Noise-Induced Hearing Loss in Construction and Other Industries

Every year, thousands of construction workers suffer hearing loss from excessive noise exposure on the job. Hearing loss impairs quality of life and increases the risk of injury – for instance, when a worker cannot hear approaching vehicles or warning signals. In the United States, the Occupational Safety and Health Administration (OSHA) set the permissible exposure limit (PEL) for construction noise to 90 A-weighted decibels (dBA) over an eight-hour period. However, noise-induced hearing loss (NIHL) usually results from extended exposure to sound levels at or above 85 dBA. The National Institute for Occupational Safety and Health (NIOSH) recommended exposure level (REL) is 85 dBA for an eight-hour period, but noise exposure in construction may exceed this standard (see page 33).

Although NIHL is a well-known risk in construction, government data among construction workers are limited. Since employers have no obligation to test workers’ hearing (audiometric testing) in construction, even if employees experience noise levels at or above OSHA’s PEL, hearing loss in construction is rarely recognized as an occupational disease. It is not surprising, therefore, that the numbers reported to the U.S. Bureau of Labor Statistics (BLS) show a very low rate of hearing loss, and for this reason hearing loss data for construction are not comparable with data for general industry.

The BLS reports diagnosed hearing loss by industry in the Survey of Occupational Injuries and Illnesses data. From 2004 to 2010, the BLS reported only 1,400 cases of hearing loss in construction. In 2010, the rate of reported occupational hearing loss among construction workers was 0.2 per 10,000 full-time equivalent workers (FTEs; see Glossary; chart 49a). Although the reported numbers indicate an overall downward trend, the small numbers are inadequate for a solid conclusion.

Hearing data are also collected by the National Health Interview Survey (NHIS), a large household survey in the U.S. At least one in five (21.4%) construction workers self-reported some hearing trouble in 2010 (chart 49b). This is nearly one-third higher than the proportion of workers with hearing trouble for all industries combined (16.3%).

Duration of occupational exposures may further increase the risk of hearing loss. Among workers aged 50 years and older who responded to a longitudinal survey, 30% of workers whose longest job was in construction trades reported fair or poor hearing compared to just 21% of workers employed in white-collar occupations in a 10-year follow-up (chart 49c).

While self-reported data are useful in assessing hearing loss, results from audiograms are more reliable in accurately determining the true prevalence. A recent study on occupational hearing loss found that 42% of the respondents who reported “good” or “excellent” hearing had hearing loss as indicated by audiometric testing. Data from the Building Trades National Medical Screening Program (BTMed) show that among construction workers examined between 1996 and 2010, 58% had significant abnormal hearing loss due to noise exposures at work. The amount of hearing loss varied by occupation; almost 80% of welders experienced hearing loss compared to 47% of roofers (chart 49d).

Under most circumstances, NIHL is preventable, yet research suggests that hearing protection usage and design in construction should be improved. The use of hearing protection devices (HPDs) is influenced by many factors, such as perceived hearing loss, education, work experience, etc. Integrating HPD training into multi-component intervention programs in construction has proven effective, resulting in substantial improvement in use among participants.

49a. Rate of hearing loss in construction, 2004-2010 (Private wage-and-salary workers)

49b. Percentage of workers with self-reported hearing trouble, by industry, 2010 (All employment)

49c. Self-reported hearing status among older workers, construction trades vs. white-collar occupations, 2008 (All employment)

Note: Chart 49b - Hearing trouble refers to workers who reported a little trouble, moderate trouble, or a lot of trouble hearing, or were deaf without a hearing aid or other listening device.
Chart 49d - Asterisk (*) represents a change in occupation title from the original data: Insulation (Asbestos worker and Insulator); Truck driver (Teamster).
