CPWR - The Center for Construction Research and Training

Fall Hazard Identification and Control Audit of the Mandarin Building

City Center Project

Las Vegas, Nevada

September, 2008

Submitted by

Mark Fullen

Wayne Lundstrom
Introduction:

The fall hazard audit of the Mandarin building included evaluation of 8 of the buildings floors. The rationale for floor selection was to select a sample floor per each phase of construction identified by the auditor. For example, the lower level floors were more complete and were in the process of installing and finishing drywall, where higher level floors still had unprotected edges. See the attached Fall-Safe audit report to review the audit report by location.

The fall hazards identified during the audit included floor holes, ladder use, scissor lift use, stairways, and unprotected sides and edges 6’ or more above a lower level. There were 589 inspection points (audit questions) collected on the Mandarin Building audit. Controls selected for the fall hazards were as follows:

- The majority of floor holes were protected with hole covers (73.46%, n=260 audit questions)
- The remaining floor holes were protected with guardrail systems.
- 2 floor holes had no protection.
- The majority of unprotected sides and edges were protected with guardrail systems (82.5%, n=120 questions).
- The remaining unprotected sides and edges were protected with employees using personal fall arrest systems.
- The audit tool considers items such as scissor lifts, ladders, and stairways the hazard and the control. The idea being that the device itself creates a fall hazard and its safe use, setup and condition provides the safe control.

Fall-Safe Audit Tool, Report and Scoring Algorithm

The Fall-Safe audit tool was designed as part of a long term intervention study conducted with small to medium sized contractor in the Mid-Atlantic and Mid-West Regions of the US. The audit tool was used as both a data collection tool for research as well as a feedback reporting mechanism for the contractors for continuous improvement. The report is organized by Location (named by the auditor), Exposure category, Intervention category, and the list of related OSHA regulatory questions relating to that specific intervention. Each question has a 0, 1 or NA. The 0 represents the answer no, the 1 represent the answer Yes and the NA means that the question does not apply. The scoring system gives a higher score for the use of engineering control over personal protective equipment as well as administrative controls such as warning lines and safety monitors. The scoring algorithm is as follows:

- Engineering Controls = Questions answered Yes / Total Questions x 100%
- Personal Protective Equipment = Questions answered Yes / Total Questions x 85%
- Administrative Controls = Questions answered Yes / Total Questions x 70%

Mandarin Building – Summary of Fall Hazards and Controls

Hole Covers

- 18 of 25 hole covers audited were not color coded or labeled (72%, n=25)
- All hole covers audited were designed to support two times the intended load (100%, n=25).
• 1 hole cover was not secured (4.17%, n=24).
• 4 hole covers created tripping hazards. The trip hazard were created from protruding nails (13.79%, n=29)
• All hole covers were free from obvious defects and secured, with the exception of one (3.45%, n=29)
• There were 2 open holes audited with no control (cover, guardrail). In these instances the audit tool allows a “No Intervention” selection and each of the 2 exposures receive a score of 0.

Guardrail Systems

• Wire rope guardrails – 3 wire rope guardrails audited were not flagged (33.3%, n=9).
• 2 guardrails could not withstand a 200 pound force (40%, n=5).
• Spacing – 2 guardrails upright spacing exceeded 8 feet (25%, n=8).
• The majority of guardrails were smooth and free of defects (80%, n=20).
• 13 guardrails audited did not have toeboards installed or they were not structurally sound. Based on the auditor’s notes, the majority of those were not structurally sound (72.2%, n=18).
• All guardrails audited were between 39” and 45”
• All wire rope guardrail audited did not deflect more than 3 inches

Ladders

• 8 of 9 ladders audited had adequate access / egress (88.88%, n=9).
• All ladders were being used properly by employees with the exception of one (88.88%, n=9)
• All ladders were the correct size for the job.
• No defective ladders beings used
• 1 step ladder was being used without being fully opened with spreader bars locked (12.5%, n=8)
• All employees on this site used proper climbing procedures (100%, n=9), 3 point contact (100%, n= 9), and no employees used the top 2 steps of step ladders (0%, n=8).
• There was one instance where a drywall bucket was being used upside down as a makeshift ladder. This was audited as a ladder with a “No Intervention” Score of 0.

Personal Fall Arrest

• The auditor identified three instances where personal fall arrest was being utilized. In all cases, the employees were using a retractable lanyard with a full body harness. All elements of the personal fall arrest systems were correct and being used properly.

Scissor Lifts

• 2 scissor lifts were identified as not being used properly (25%, n=8).
• 2 scissor lifts in use did not have the entrance gate or chain in place (33.33%, n=6).
• No scissor lifts were identified as having obvious defects (100%, n=8).
• There was one instance of an employee not standing firmly on the floor of the basket (12.5%, n=8)

Stairways
• 1 handrail audited was not capable of withstanding 200 pounds. (25%, n=4).

Conclusion

The fall hazards identified in the building audit, especially worker behavior created hazards, were starkly different than in the Aria building. Employee use of ladders on the Mandarin site was nearly perfect, and the hazards identified were not as serious. This site also had many more holes than the Aria building, yet the holes were more often properly protected. The exception being the 2 open holes with no protection.

The majority of the fall hazards identified that were not properly controlled in this audit were in the areas of guardrails and hole covers. The majority of the guardrails that required toeboards utilized the screens that meet the 200 pound strength requirement if anchored properly. In most cases, the screens had become loose and were not re-secured properly creating a falling object and falling hazard. Also, some of the wire rope guardrails were not properly flagged, although not as many deficiencies as the Aria site. The low frequency ladder deficiencies included not properly setting up the ladder and one instance of poor access egress. One drywall bucket being used as a ladder and was identified as having no safe intervention. Scissor lift hazards were higher on this site with fall hazards created by not closing the gate / chain, and by not standing firmly on the floor of the basket. Additionally two scissor lifts were identified as not being used properly.

Fall hazards that were well controlled were those that utilized personal fall arrest. Mandarin had 3 instances of personal fall arrest usage with all requirements being met. All stairways audited met the requirements with one exception of a handrail not meeting a 200 pound breaking strength.

This site utilized engineering controls (guardrails, hole covers) over personal fall arrest which is a preferred method. The recommendation would again be to implement an intensive fall hazard control maintenance program that ensured the security. Strength and required identifiers for all guardrails and hole covers. Personnel should be trained in the requirements of hole covers and guardrails as well as user training for all types of ladders and scissor lifts and aerial lifts.

The Site Summary Score of 82.33% would be considered an acceptable score if this contractor were part of the Fall-Safe program. On average the baseline audit scores of the Fall-Safe contractors were much lower that this score (approximately 70%). Although it could be argued that this audit would not be considered a baseline audit due to the recent efforts on site.
## Fall-Safe Program Management and Related Functions

**Company:** Perini  
**Visits Date:** 7/25/2008

**Site:** Mandarin  
**Workers Managed:** Approximately 6,000
