

THE CENTER FOR CONSTRUCTION
RESEARCH AND TRAINING

WELCOME & THANK YOU FOR JOINING...

**CPWR's 2025 r2p Seminar
& Partnership Workshop**

June 4, 2025

The background of the slide features a silhouette of two construction workers standing on a steel framework, likely a building under construction. The scene is set against a warm, golden light, suggesting either sunrise or sunset. The workers are positioned in the center of the frame, with their forms dark against the bright sky. The steel structure consists of various beams and supports, creating a complex geometric pattern.

Advancing Heat Safety in Construction

CPWR 2025 r2p Seminar & Partnership Workshop

CPWR 
THE CENTER FOR CONSTRUCTION
RESEARCH AND TRAINING

I would like to thank my colleagues and acknowledge their great work!

Official Research Team

- Gavin West
- Cora Roelofs
- Rosa Greenberg
- Walter Jones

Extended CPWR Family

- Jessica Bunting
- Amber Trueblood
- William Harris
- And more...

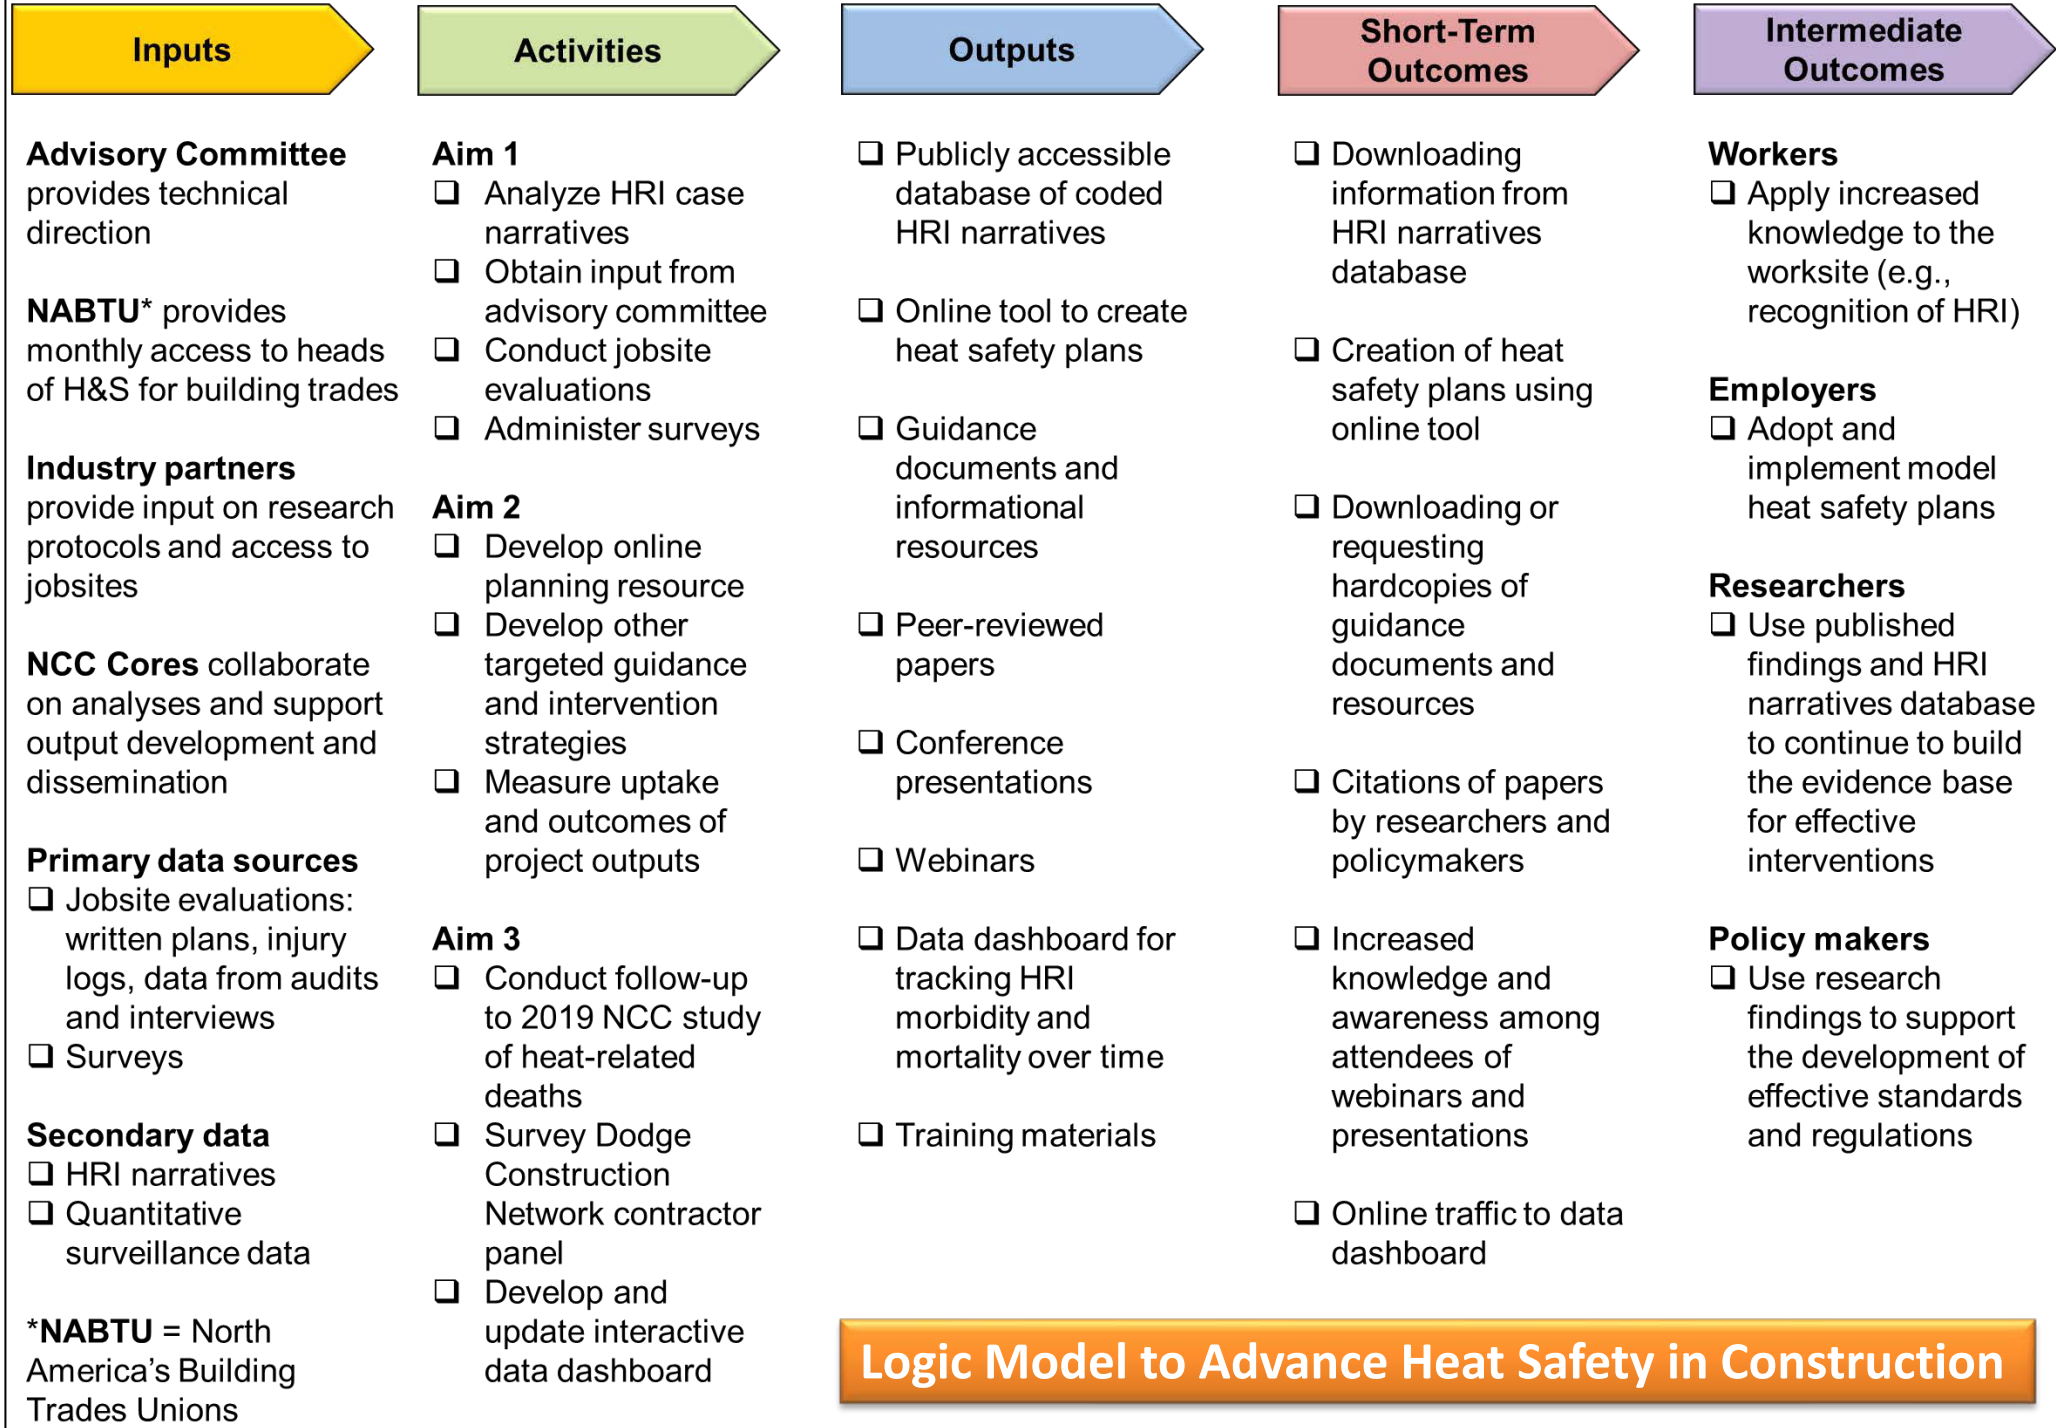

The project has three specific aims paraphrased here:

1. Identify construction activities that pose a high risk of heat stress and collect info on the use of new and existing heat stress solutions
2. Develop guidance, resources, and intervention strategies
3. Measure heat-related morbidity, mortality, and adoption of heat stress solutions sector over time

Recent studies of workers' comp data show that heat stress increases the risk of traumatic injuries like falls. Can you spot any unsafe work practices in this PPT stock photo?

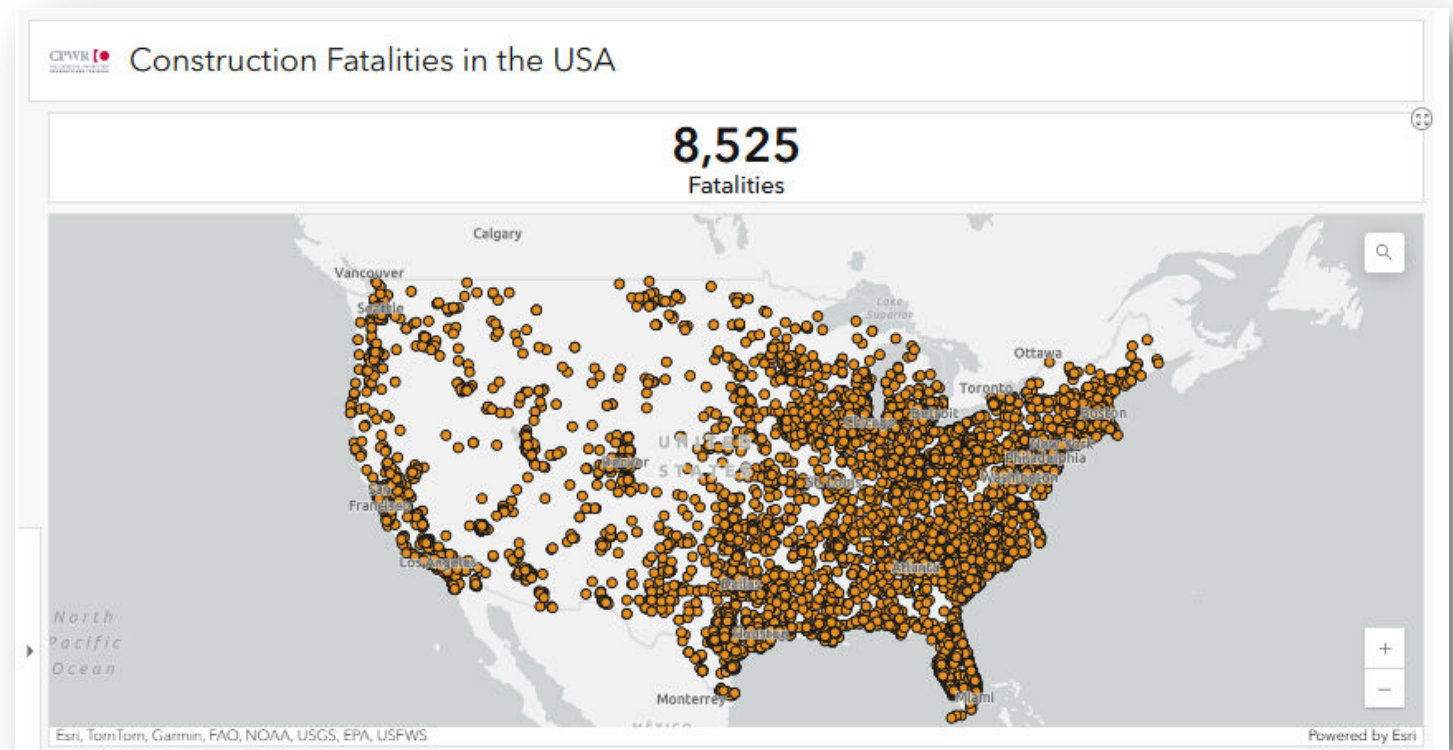

Logic Model to Advance Heat Safety in Construction

| Timeline of activities | | YR1 | YR2 | YR3 | YR4 | YR5 |
|------------------------|--|-----|-----|-----|-----|-----|
| Aim 1 | Phase 1: Analyze HRI case narratives | x | x | | | |
| | Phase 2: Meet with advisory committee bi-annually | x | x | x | x | x |
| | Phase 3: Conduct jobsite evaluations | x | x | x | x | |
| | Phase 4: Develop and administer online surveys | | x | x | x | |
| Aim 2 | Develop and launch online planning tool | | | x | x | |
| | Enroll study participants to use and evaluate online planning tool | | | | x | |
| | Develop and disseminate other guidance and educational resources | | | | x | x |
| Aim 3 | Conduct follow-up to 2019 CPWR study of heat-related deaths | x | x | x | | |
| | Dodge Construction Network Construction Safety Management Survey | | x | | | x |
| | Create and continue to update interactive data dashboard | x | x | x | x | x |

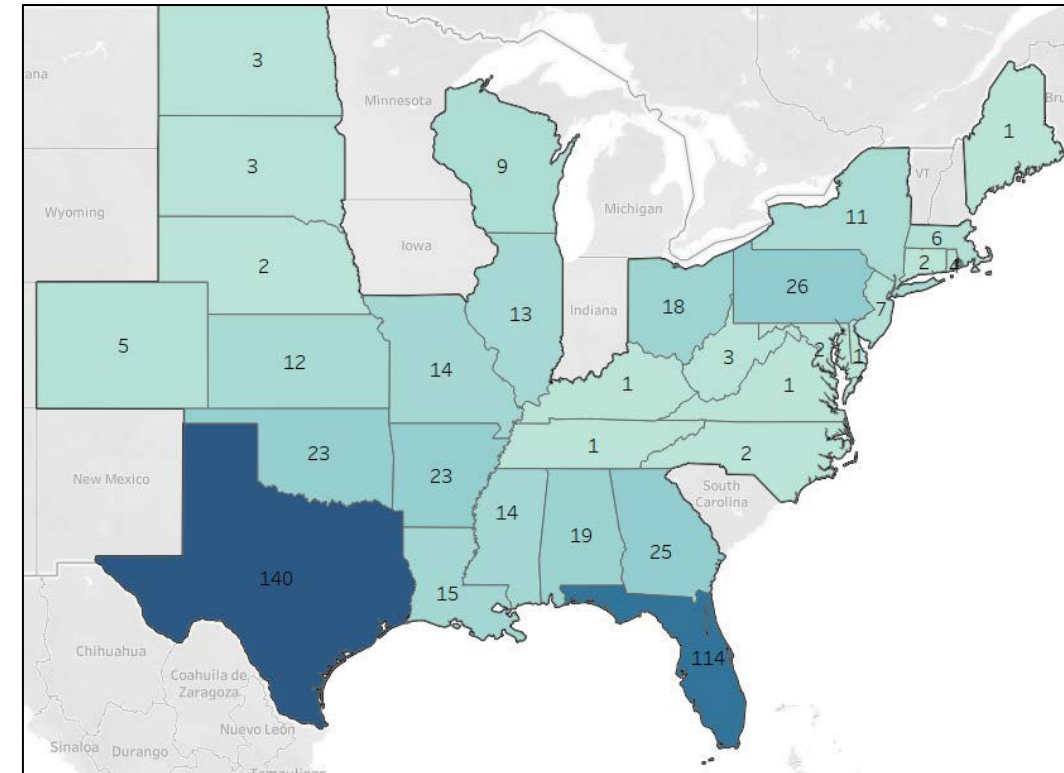

We have been coding and analyzing heat-related illness and injury narratives from three data sources

1. OSHA Severe Injury Reports
2. CPWR Fatality Map
3. NIOSH FACE Reports

Selected preliminary results from the coding and analysis of federal OSHA Severe Injury Report Narratives (2015-2023):

- 524 heat-related severe injuries reported
- Heat-relatedness uncertain in 10% of cases
- Occurred in all areas of the country subject to federal OSHA reporting requirements
- 31.5% involved an OSHA inspection
- 13.5% indicated a delayed response to signs and symptoms
- 54 severe fall injuries identified where heat may have been a contributing factor
- Ambient temps ranged from 72 to 110 (°F)
- Ambient heat indexes ranged from 82 to 111 (°F)

We are working with a large contractor to schedule our first site visit possibly as soon as next week

- Visit 3-4 sites each summer
- Conducted by 2-3 staff members
- Assess site conditions and heat safety practices on 2 or 3 separate days
- Survey and interview upper management, supervisors, workers
- Strive to cover different geographic regions
- Compare what works well for different employers (e.g., large vs. small)

Research questions for the site visits:

How do workers and management describe the impacts of heat?

Health
Operations
Other

How are heat illness prevention strategies and procedures being implemented at the worksite?

Feasibility
Effectiveness
Challenges

What are the impacts of these strategies and procedures?

Health
Operations
Other

How could heat illness prevention strategies and procedures be improved?

Supports needed
Technology innovations
Readiness for change

Site visit instruments are undergoing IRB review

Contractors: Help Researchers Find Ways to Keep Your Workers Safe in Hot Weather

CPWR—The Center for Construction Research and Training is conducting a research study to understand and improve heat safety to better protect construction workers.

Project Goal: Develop and share strategies to prevent heat-related illnesses and save lives.

Research Questions

1. What are the impacts of extreme heat?
2. How is extreme heat managed at the job site?
3. What is working well to manage the effects of heat on workers and what areas remain challenging?
4. What are the opportunities for improvement?

Who Can Participate?
We are looking for construction firms, preferably with active worksites in Maryland or the Washington DC metro area, to participate in the study.

Study Process and Expectations¹
Researchers will visit the site on two to three days during the summer of 2025 to collect information about the implementation and impact of heat illness prevention plans. This will include:

- A kickoff meeting to introduce the study and outline the process
- A walk-through of the site to observe heat illness prevention practices
- Management interviews to learn about supervisors' experiences, challenges, and needs with heat safety
- Brief worker surveys to gather their insights and experiences
- Wrap up meeting to report findings and answer questions

Ethical Considerations
Your company name will not be used without permission. Participation is voluntary and confidential. Participants may choose to withdraw from the study at any time.

¹Details related to scheduling, walk-throughs, safety procedures, etc. will be discussed prior to enrollment.

4. Site Walkthrough Form
5. Qualtrics Online Worker Survey
6. Worker Interview Guide
7. Recruitment flyer for Contractors
8. Recruitment flyer for Workers

We continue to work closely with our Data Center colleagues on Aim 3 activities

- Prepared and submitted BLS proposal to analyze heat-related deaths reported in the CFOI
- Developing a CPWR Data Bulletin and accompanying interactive Data Dashboard to be published in August
- Publishing findings from the narrative coding and analysis in a peer-reviewed journal

r2p activities and dissemination efforts thus far include

Invited Presentations:

1. International Finishing Trades Institute Health & Safety Symposium
2. National Work Zone Management Conference
3. Inaugural Occupational Health in Maryland Forum at UMD School of Public Health
4. NASCC: The Steel Conference
5. Michigan Safety Conference

Other Activities:

- Helped develop & review **Professional Development Course (PDC) for AIHA Connect 2025** coordinated by the Construction and Thermal Stress committees
- Compiled and shared **info on real-world best practices in response to a request for information** from Larry Sloan (AIHA CEO) and the National Commission on Climate and Workforce Health
- Provided **technical support to North America's Building Trades Unions (NABTU) on Federal OSHA's heat rulemaking**

Thanks! Questions?

Challenges in current safety and health practices

- Limited Adoption
- Focus on Behavior, Not Systems
- Mental Health = Afterthought
- Low Engagement & Leadership Buy-in

Adapt and integrate successful interventions to address these challenges

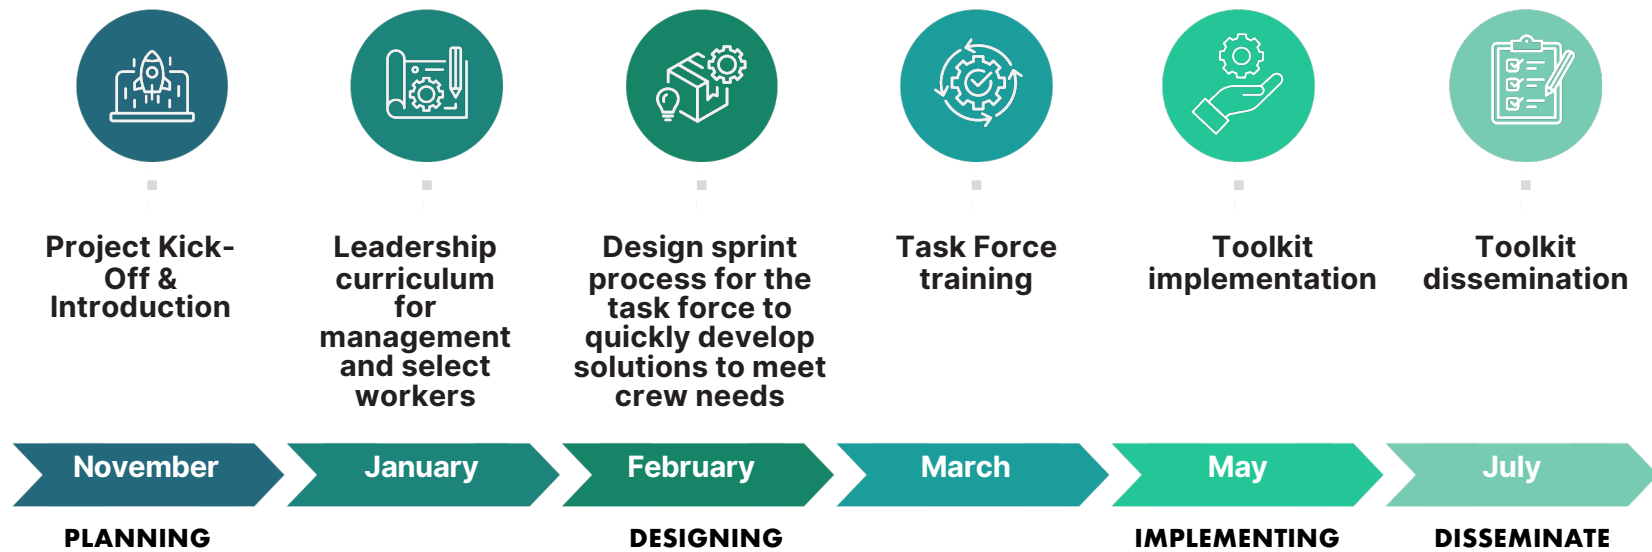

Project Goals & Aims

Goal: To help contractors adopt and implement solutions that enhance safety and mental health and well-being with leadership support and crew ownership and leadership.

Development process with advisory board

Meet to provide feedback on each of the following stages of toolkit development

Year 1: 2024 - 2025

What is the Built to Last (BTL) Toolkit?

 Built for construction

 Builds leadership and crew ownership and voice

 Links safety and mental health

**Prepar
e**

Design sprint

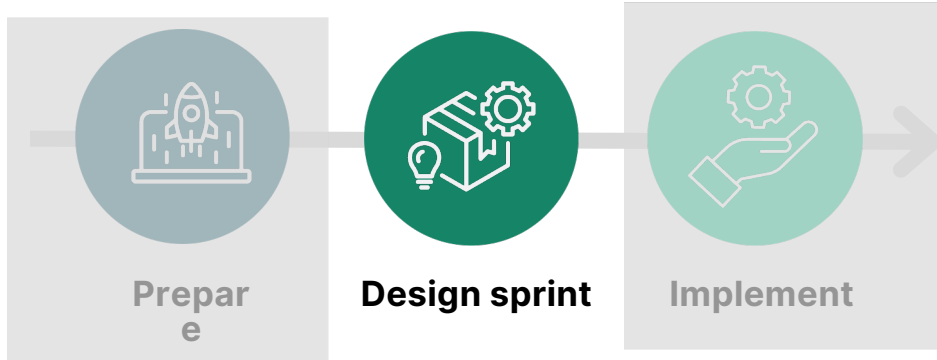

Implement

| Activity | Duration | Focus |
|------------------------|-----------------|---|
| Leadership training | 2-3 hours | Skills + applied scenarios |
| Facilitator support | 90 mins | Facilitation skills, TWH approach, and design sprint process |
| Task force orientation | 60 mins | Roles, teamwork, trust, TWH approach, and design sprint process |

Prepar
e

Design sprint

Implement

| Activity | Duration | Focus |
|-----------|------------|---|
| Implement | 1-3 months | Use solution implementation plan created during sprint to implement solutions |

Who uses the toolkit on site?

Leaders who will support facilitators and task force along the way and support implementation of solutions

Facilitators (~2) who guide the process, such as a safety professional and a crew member

A **“task force”**, including:

~3-5 management representatives

~3-5 worker representatives

No one with direct supervisory relationships

When & who would they use the toolkit?

- ✓ Starting new programs
- ✓ Fixing old ones
- ✓ Building leadership
- ✓ Upskilling safety and health committees

USERS

Sub-contractors

General contractors,
internally & with subs
on jobsites

Other users? E.g.,
unions, workers' comp

Advisory board feedback

May 2025

 **Toolkit strategy:** Promote entire toolkit, with early steps to build value and understanding

 **Engagement levels:** Low, medium, & high touch points

 **Users:** Primary users, early adopters, consider company size

 **Messaging:** Simple, actionable, value-focused

 **Outreach:** Trusted networks

 **Barriers:** Time, cost, & buy-in

Opportunities for next steps

 **Pilots & feedback:** Continue piloting toolkit and refining as we go

 **Presentations:** Industry presentations

 **Scalability:** Other use cases, industries, etc?

Thank you!

Questions?

Extra

Core pieces of the toolkit

Prepare

- Leadership training
- Facilitator & task force training
- Needs assessment

Design sprint

A structured, time-constrained process to solve critical business challenges, test ideas and create innovative solutions within just five sessions.

Implement

Implement solutions using plan created during the last design sprint session

Leadership training for jobsite leadership, facilitators, and task force members

- Provide leadership support before investing in identifying hazards, designing solutions, and implementing solutions
- 2-3 hours
- Training includes:
 - "The why", 5 key leadership skills, and application via scenarios

5 LEADERSHIP skills

- 1 Leads by example
- 2 Engages and empowers team members
- 3 Actively listens and practices three-way communication
- 4 Develops team members through teaching, coaching, & feedback
- 5 Recognizes team members for a job well done

Facilitator support

Facilitator Role: A Guide

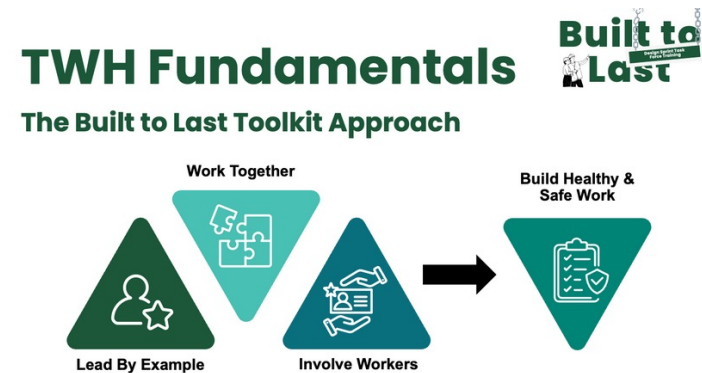

Architect: Helps the group create its purpose, desired outcomes and design of the meeting

Pilot: Ensures meeting space, materials and support personnel are appropriate for achieving desired outcomes. They clarify where the group is going and the path to get there

 **Guide:** Helps the group navigate the process by being prepared to facilitate them through doubt, fear and disagreement

- Provide support for key personnel facilitating workers and supervisors through the design sprint process
- 90 minutes
- Training includes:
 - Key facilitation skills, Total Worker Health approach fundamentals, and overview of the design sprint process

Task force orientation

- Orientation for the task force who would gather information on workforce needs and conduct a design sprint to develop solutions to meet the needs
- 60 minutes
- Training includes:
 - Roles and responsibilities, group dynamics/trust/engagement, Total Worker Health approach fundamentals, and overview of the design sprint process

Design sprint guide

- Structured process to quickly develop solutions to meet workforce needs
- 5-session (2-hours each)
- Sessions include:

Aim 2: Employ multiple channels—including email, websites, media placements, direct mail, social media, and webinars—to share research findings and translational products.

Media Placements -- On pace for approximately 85, similar to last year

Direct Mail -- Promotional mailing (7,000)
Academics
Safety and health professionals
Trainers

Annual Report (12,000)

Social Media -- Post 10 times a week per platform

Aim 3: Evaluate and improve Center products and outreach methods through engagement metrics, market surveys, and interviews.

Aim 3: Evaluate and improve Center products and outreach methods through engagement metrics, market surveys, and interviews.

Interactive Chart Book

The Interactive Chart Book is the latest format of *The Construction Chart Book- The U.S. Construction Industry and Its Workers*. This new format provides the ability for data to be updated as available, as well as for dynamic key findings to be presented that update with included filters.

- Industry, Business, and Owner**
Information on construction establishments, construction spending, and business owners.
- Employment, Income, and Benefits**
Information on employment trends, retirement plans, Hispanic workers, and Women in Construction.
- Injuries, Illnesses, and Other Health Topics**
Information on fatal and nonfatal injuries, mental health, and causes of death.
- Hazards and Exposures**
Information on exposures, such as hazardous environments, lead, and nanomaterials.
- Other Topics**
Information on OSHA Inspections, Hours Worked, and other topics not covered elsewhere.

Product Highlight #1

Harris, W., Trueblood, A. B., Yohannes, T., Rodman, C. P., & Rinehart, R. (2025). Suicides among construction workers in the United States, 2021. *American journal of industrial medicine*, 68, S144-S151.

<https://onlinelibrary.wiley.com/doi/10.1002/ajim.23632>.

Abstract

Background

Construction workers have the second highest suicide death rate; despite this, there is limited literature examining suicides in the industry, which is necessary to identify those at higher risk of death by suicide. The objective of this study was to examine the characteristics of those who died by suicide in construction to address this knowledge gap.

Methods

Data from the National Center for Health Statistics National Vital Statistics System 2021 public use Mortality Multiple Cause-of-Death file were used to identify deaths by suicide, while denominator data for rates come from the 2021 Current Population Survey.

Results

In 2021, construction workers were disproportionately affected by suicide deaths. Almost a fifth (17.9%) of deaths by suicide with a reported industry code were in construction, despite construction workers accounting for only 7.4% of the workforce. Male construction workers accounted for a majority (97.8%) of suicide deaths. The highest percent of deaths by suicide were among individuals who were white, non-Hispanic, completed high school or equivalent, and single, across construction and all industries for males and females.

Discussion and Conclusions

Male and female construction workers had the highest rates of suicide across all characteristics when compared to all industries. Our findings support the need for ongoing prevention efforts within the industry. Future research is needed to understand suicide risk among certain characteristics and occupations. In addition, the work environment or other work-related factors should be studied to understand how the unique nature of the construction industry may be associated with higher suicide rates.

Developing a national roadmap to reduce per- and polyfluoroalkyl (PFAS) exposures among construction painters and allied trades

The Boston Globe

UMass Lowell to conduct study on exposure to PFAS, or 'forever chemicals,' among construction workers

"There is no way for anyone to look at a can of paint and say, this one has PFAS, how much of it, or what types."

By [Nathan Metcalf](#) Globe Correspondent, Updated March 8, 2025, 2:36 p.m.

Research Focuses on Construction Industry

Researchers target sources of exposure to forever chemicals

April 29, 2025

Researchers at the University of Massachusetts Lowell (UMass Lowell) are conducting a new study to assess per- and poly-fluoroalkyl substances (PFAS) in construction materials and the exposure levels among construction workers, bringing new attention to this issue.

Researchers to Identify 'Forever Chemicals' in Commonly Used Products

Dhimiter Bello, Anila Bello and Kushal Biswas '21, research assistant and Ph.D. Pharmaceutical Sciences alumnus, are analyzing PFAS exposure among construction workers.

11/14/2024
By [Karen Angelo](#)

Workers in the construction trades use a variety of products such as paints, varnishes, adhesives and glues, all of which contain dangerous per- and poly-fluoroalkyl substances (PFAS). Known as "forever chemicals" for their propensity to persist in the environment and accumulate in the human body, PFAS are linked to adverse health effects such as kidney disease and a range of cancers.

The amount of PFAS exposure among construction workers is not yet known, but a new study aims to assess the extent and sources of PFAS exposure to inform safer industry practices.

Assoc. Dean for Research and Graduate Studies [Dhimiter Bello](#) and Public Health Research Assoc. Prof. [Anila Bello](#), both of the [Zuckerberg College of Health Sciences](#), have received a \$200,000 grant from The Center for Construction Research and

PFAS in construction

A wide range of materials in the construction

- Concrete mixtures
- Tiles
- Floor waxing
- Wood sealants
- Adhesives used in roofing, flooring, and carpeting
- Metal structure coating products

Limited data on PFAS content and often proprietary!
SDS do not report PFAS!!!

Healthy Building Network report

- 94 Paints from 8 major manufacturers
- 65% of the paints and coatings market share in North America
- 50% of paints contained Total Fluorine (maker for PFAS) at concentrations 42-688 ppm.

Serum Concentration of Selected Per- and Polyfluoroalkyl Substances (PFAS) by Industry and Occupational Groups Among US Adult Workers, NHANES 2005–2014

Ja K. Gu¹ | Luenda E. Charles¹ | Chol Seung Lim² | Anna Mnatsakanova¹ | Stacey Anderson³ | Lisa Dzubak³ | Erin McCanlies¹

“Among 21 industry groups, the highest geometric mean PFAS levels (ng/mL) were observed in Construction (PFOS = 12.61 ng/mL, PFOA = 3.76, PFHxS = 2.10, PFNA = 1.23, and PFDA = 0.33)”

Project Goals and Specific Aims

The long-term goal of the project is to reduce and, where possible, eliminate PFAS exposures at the source, ultimately minimizing health risks among construction painters and allied trades.

Aim 1. Identify construction trades with the highest PFAS burden via serum and urinary biomonitoring.

- Assess PFAS burden through serum and urinary biomonitoring among painters and allied trade workers.

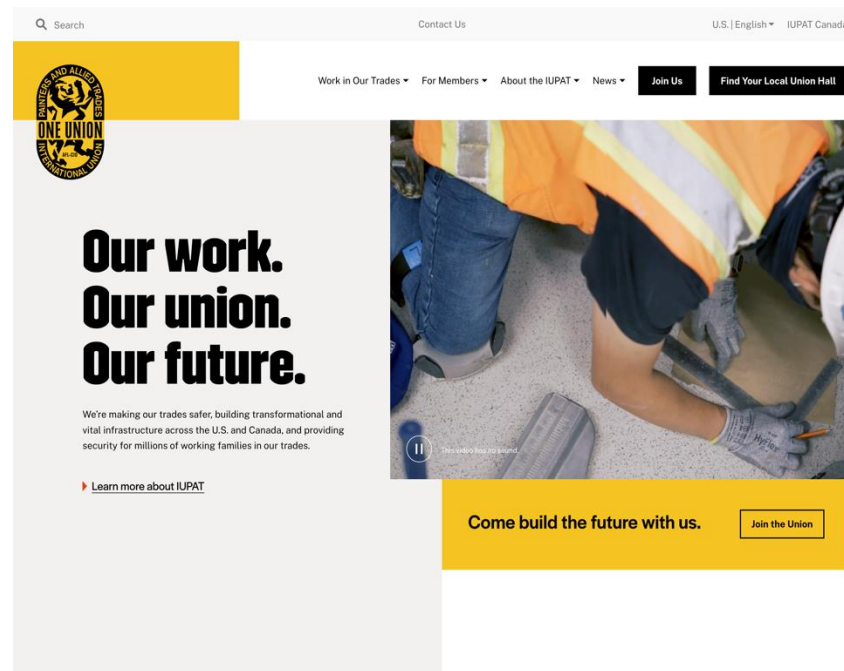

Aim 2. Assess PFAS occupational exposure sources among painters and allied trades through product characterization, inhalation and dermal exposure measurements, and matched blood and urine biomonitoring.

- Determine PFAS species and their concentrations in products used by painters and allied trades workers via independent chemical analyses.
- Identify major PFAS occupational exposure sources and pathways through simultaneous assessment of airborne and dermal exposure with matched blood and urine biomonitoring.

Aim 3. Translate and disseminate the findings (e.g. guidelines for clinicians)

Survey Development

- The survey was developed
 - Based on a literature review and consultation with our European collaborators and NIOSH
 - The draft was reviewed by the health and safety trainers at IUPAT; and CPWR.
 - Feedback from experienced industrial hygienists.
- The survey was entered into REDCap (Research Electronic Data Capture)- an online platform to build and manage surveys
- The survey contains 4 parts :
 - Part 1: General information about work history and sociodemographic information
 - Part II: Specific activities, products, materials, used as work, training, and PPE use (painters, allied trades, and retired – subcategories)
 - Part III: PFAS lifestyle exposures (adapted from ATSDR survey)
 - Part IV: Health outcomes

Chemical Exposures among Painters and Allied Trades AAA
Page 1 of 7

Questionnaire on Health Effects from Occupational Chemical Exposures
among Painters and Allied Trades

Thank you for completing this questionnaire. In doing so, you are helping an important research project that is taking place at UMass Lowell to study the impact of hazardous chemical exposures, especially PFAS, on the health of painters and allied trades workers.

This questionnaire collects important information on work activities, materials used, and factors that might affect your exposure to hazardous chemicals in the job, and your health. This questionnaire is very important to us in understanding and interpreting the laboratory results. Answering these questions should take no more than 10 minutes. This questionnaire is as important as the collection of blood and urine.

Your individual information will be kept confidential, and your presentations, and publications of data, which will be aggregated. Please leave a contact information (email, phone number or be happy to follow up with you.

If you have any questions about the survey please reach out to

Anila Bello ScD, M.Sc
Department of Public Health

Ongoing Field Study

- 203 participants recruited as of May 31, 2025
 - Re-purposed budget lines to prioritize participant recruitment
 - \$100/ per individual
 - \$21k total investment
 - Collected 4 blood tubes/worker * 202 workers = 808 blood tubes
 - Collected 202 urine samples
- Biobanking for long-term storage and multiple purposes
 - Blood has been processed, aliquoted, and properly stored in -80 °C
 - Urine has not been processed
 - UML IRB and IBC-compliant protocols
- Survey was completed by 203 participants
 - Demographics, exposure histories, trades, health status
- Data are stored in REDCap

Preliminary data - survey results

Participating trades

Have you ever been diagnosed by a doctor with any type of skin allergy or eczema?

Counts/frequency: Yes (11, 6.3%), No (158, 90.3%), Don't Know (6, 3.4%)

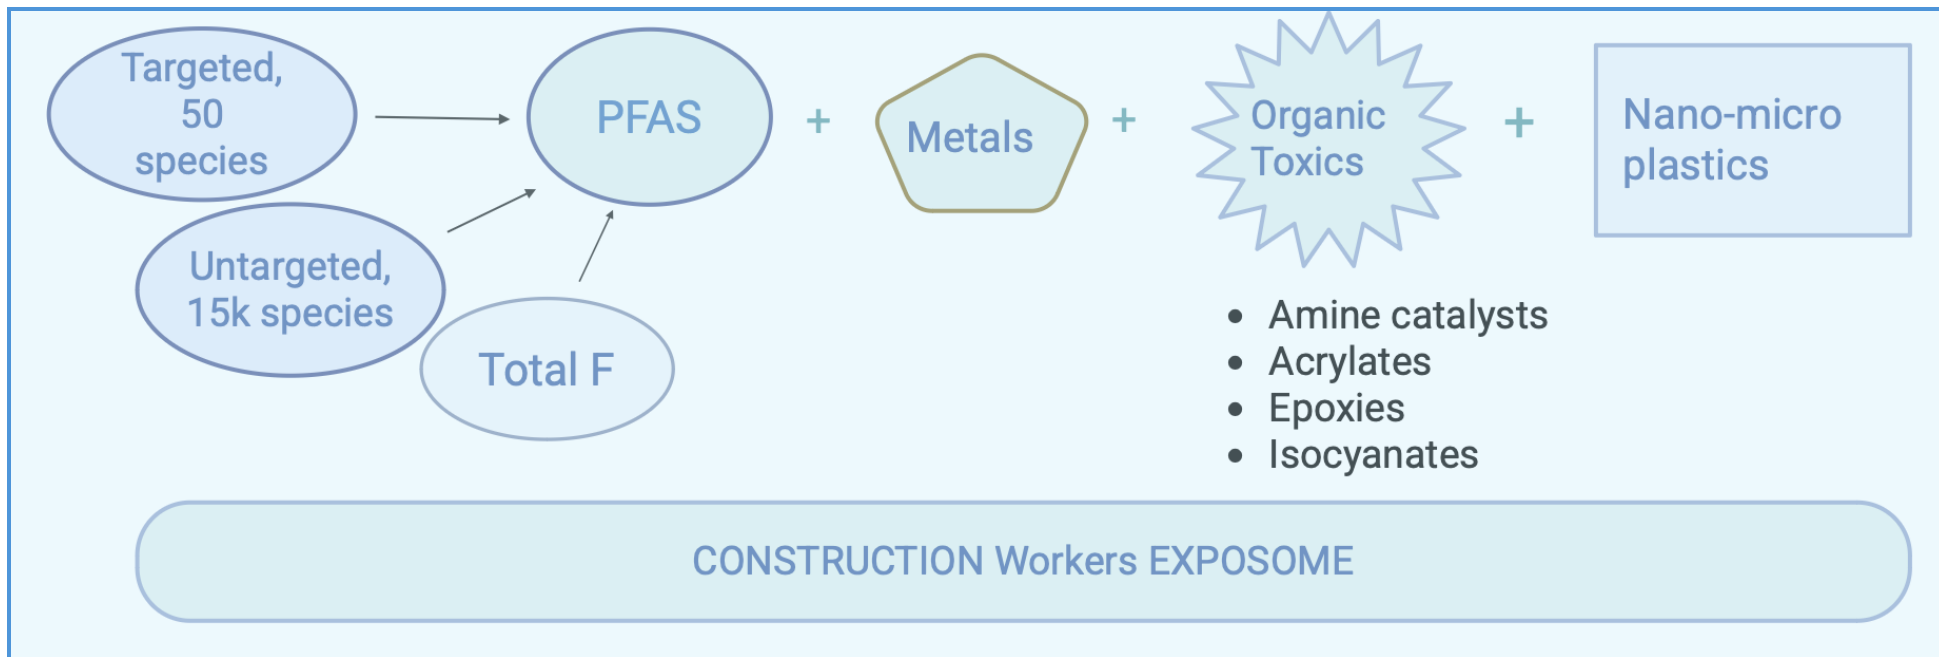

Asthma

Counts/frequency: Yes (18, 10.4%), No (155, 89.6%)

Defining the construction workers' exposome

Consensus Study Report

(eFOSAA)

Next Steps

- Complete a nationwide survey of exposures and health outcomes
 - We aim to deploy the survey for 6-12 months
 - Analyze the data to identify specific health concerns for different trades
- Analyze PFAS in 203 blood and urine samples – develop risk bands
- **Communicate findings and develop intervention to reduce PFAS body burden and detox PFAS and other toxins!**
- Analyze 100 representative products
- Identify and communicate PFAS exposure sources
- Apply for additional funding to:
 - **Expand PFAS biomonitoring nationwide !**
 - Establish a baseline of adverse health effects and document intervention efficacy and impact through highly sensitive and integrated omics – deep RNA seq, proteomics, metabolomics, urinary exposome and adductome...

OUR RESEARCH TEAM

Anila Bello and Dhimiter Bello, PIs

Kushal Biswas, PhD candidate; Abimbola Ojo, ScD candidate; Suresh Bhandari, PhD candidate

Noemi D, a talented phlebotomist, Marlee, Talita, Mike, Bernie

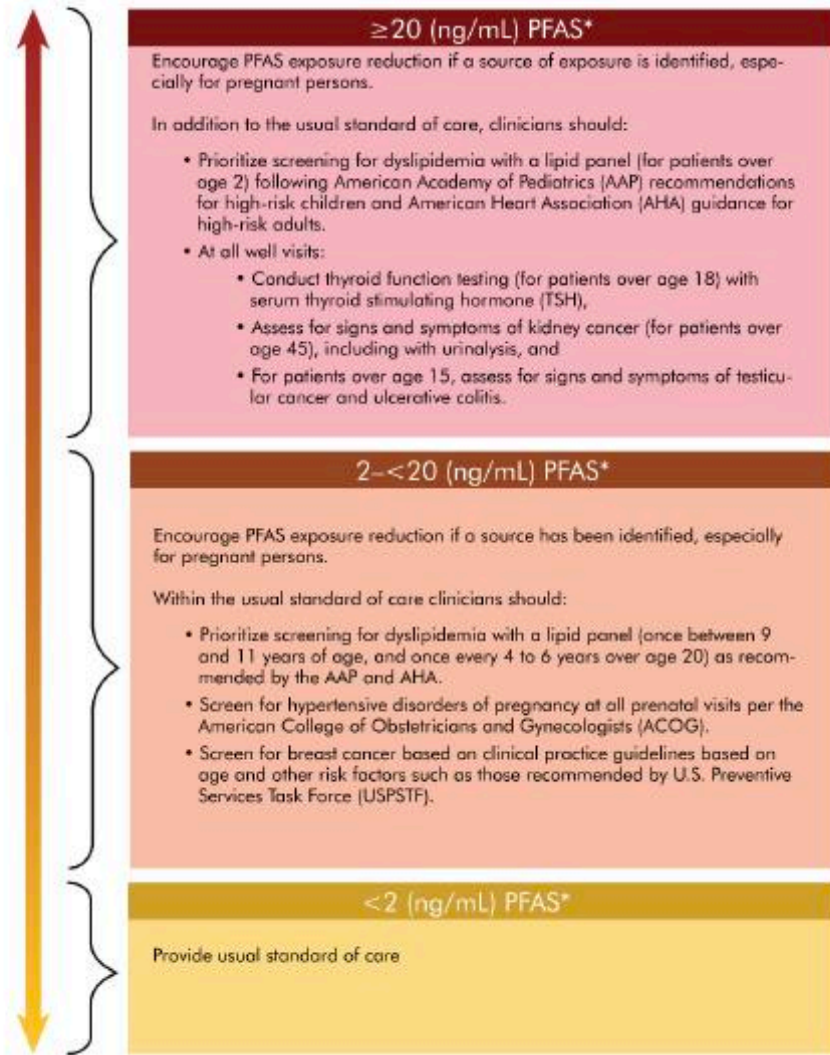

After a long day of sampling (70 participants)

Last day of sampling – participant #203

*Thank you for your attention and
support!*

- Screen for breast cancer based on clinical practice guidelines based on age and other risk factors such as those recommended by the U.S. Preventive Services Task Force (USPSTF).

PFAS Toxicology

STRONG EVIDENCE

1. Hypertension
2. Dyslipidemia
3. Hyperuricemia – high levels of uric acid in urine – strong human epi evidence
4. Kidney cancers
5. Testicular cancers

* Simple additive sum of MeFOSAA, PFHxS, PFOA (linear and branched isomers), PFDA, PFUnDA, PFOS (linear and branched isomers), and PFNA in serum or plasma

FIGURE S-6 Clinical guidance for follow-up with patients after PFAS testing.
 NOTE: MeFOSAA = methylperfluorooctane sulfonamidoacetic acid; PFDA = perfluorodecanoic acid; PFHxS = perfluorohexane sulfonic acid; PFNA = perfluorononanoic acid; PFOA = perfluorooctanoic acid; PFOS = perfluorooctanesulfonic acid; PFUnDA = perfluoroundecanoic acid.

Evaluation and Improvement of OSHA 10-Hour Construction Safety Training

2025 R2P SEMINAR &
PARTNERSHIP WORKSHOP
June 4, 2025

Mark Fullen - West Virginia University – Safety & Health Extension

Kimberly Rauscher - Boise State University - Department of Community and Environmental Health

Wayne Lundstrom - West Virginia University – Safety & Health Extension

Douglas Myers - Boise State University - Department of Community and Environmental Health

Brandon Takacs – Formerly West Virginia University – Safety & Health Extension

Eric Lundstrom – Former Graduate Research Assistant, West Virginia University, Epidemiology, West Virginia University

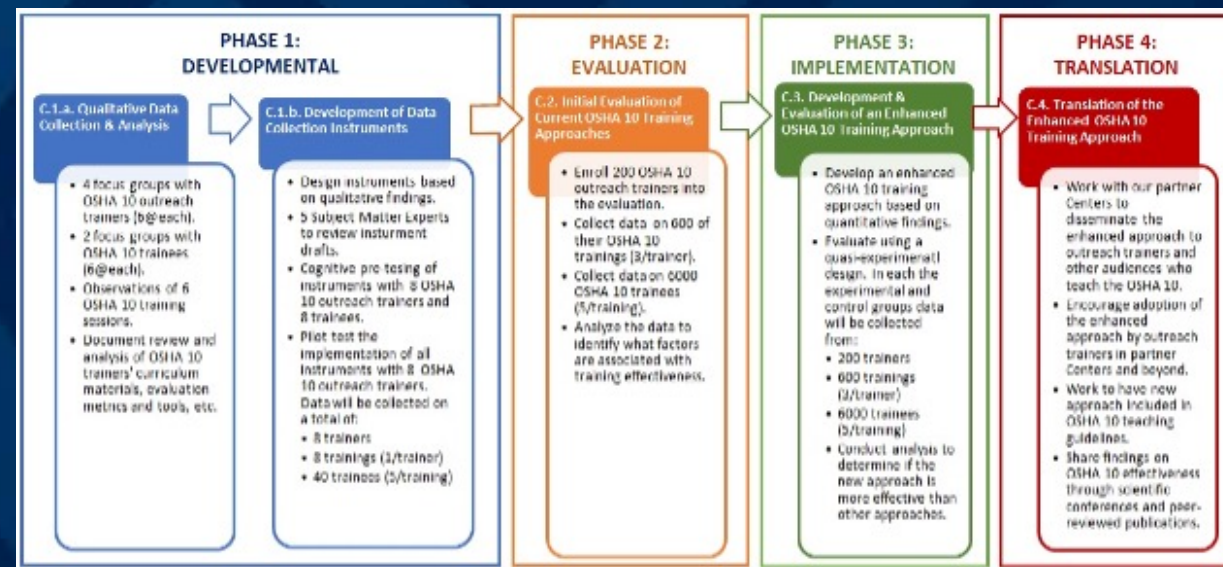

Refresher on the Project

- **Study Objectives**

- To understand the current approaches used by Outreach Trainers when teaching the OSHA 10
- Evaluate the quality of these approaches and identify areas in need of improvement
- Develop an enhanced OSHA 10 training approach that addresses current areas of weakness
- Translate the new approach into practice among Outreach Trainers.

Refresher

- 5-year, mixed-methods study in four phases (Developmental, Evaluation, Implementation, Translation)
- Curriculum review, student and trainer interviews and surveys, training evaluations, and student knowledge assessments
- Recruited OTIEC's, OSHA 10 authorized outreach trainers and trainees.

The Most Effective Safety Training

- The best evidence-based approach to train adults is to use:
 - Interactive
 - Learner-centered methods that incorporate real-world applications
 - Build on learners' prior knowledge
 - Promote active engagement through discussion, problem-solving, and hands-on practice

OSHA Training Requirements

- Outreach Training Program training must meet adult learning needs and include interactive activities.
- Training must include workshops, case studies, exercises, and demonstrations that involve student participation and interaction
- Videos cannot comprise more than 25% of the instructional time spent on OSHA Outreach Training Program.”
- OSHA’s publication “Resource for Development and Delivery of Training to Workers” states that: Activity-based learning should fill at least two-thirds of training hours (no more than one-third is lecture).

Emerging Themes from the evaluation phase of the study

- Trainers are confident and comfortable and they see value in conducting engaging, hands-on activities with their students.
- Classes often delivered with a minimal amount of preparation time and customization.
- Classes often delivered in training facilities not conducive to conduct hands-on activities.
- Trainers most often utilize pre-developed curriculum from OSHA.gov, lecture with slides and videos with little engagement

Training content available from OSHA

- Much of the material does not meet the learning objectives set forth by OSHA.
- For a trainer to ensure that they meet the learning objectives they must make decisions about what and how they will embed hands on activities into the training material.
- Trainers don't tend to have the time or desire to do this, and even if they do, the material is not easy to find and sift through.

Student Satisfaction Survey Results

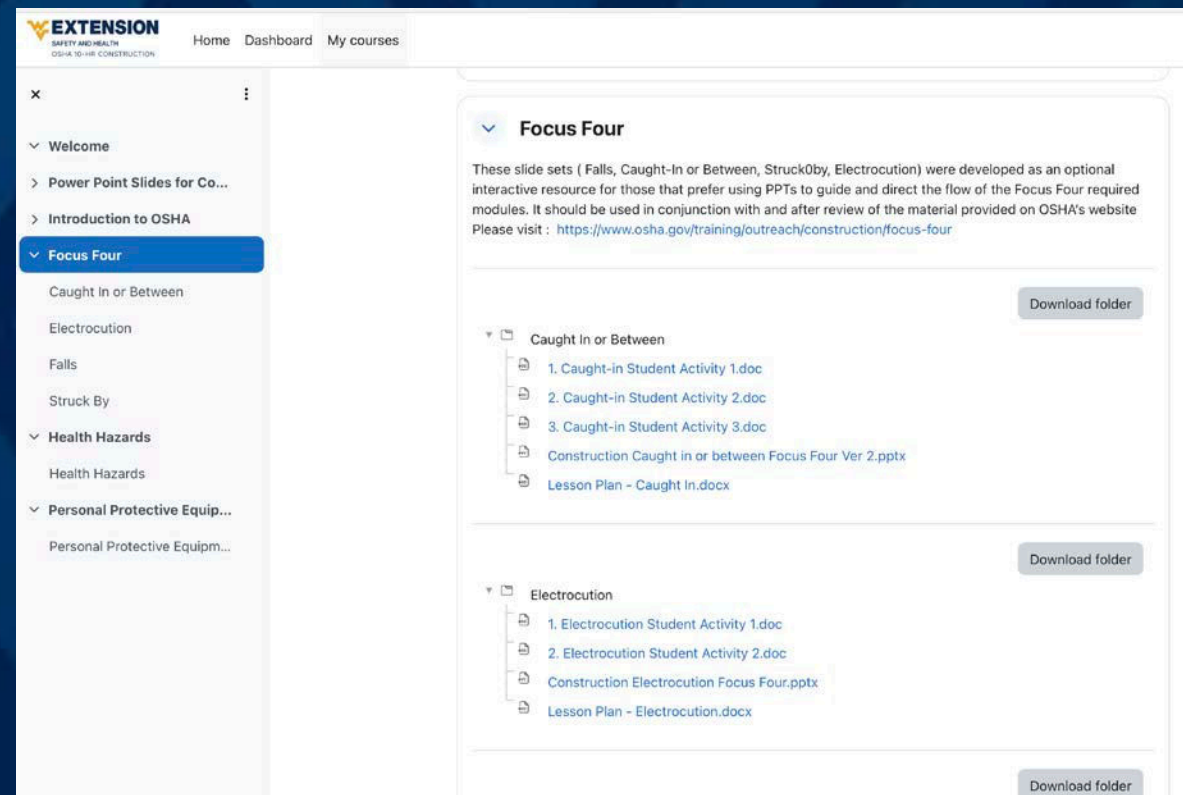

- 48% of students reported listening to lectures and/or watching videos for 7 to 8 hours out of the 10 hours of class.
- 25% of students reported that less than 1 hour was spent in interactive activities or small group exercises and 17% reported only 1 to 2 hours.

Current Status of Project

- Based on our findings and meeting OSHA learning objectives, we developed new and revised some existing OSHA 10 mandatory topics curriculum. This included:
 - Revising the “Introduction to OSHA” presentation and embedding the required hands-on activities to make it seamless for the trainer.
 - Embedding hands-on activities into the existing PPE and Health Hazard modules. These modules already met the learning objectives.
 - Developing new Focus Four training material and hands-on activities and embedding hands-on activities that guide both the trainer and the student.
 - Developing new lesson plans for each module.

Current Status of Project

- Instructions, Curriculum and Lesson Plans available online at: <https://constructionosha10.org/>
- continue to collect pre and posttests, satisfaction surveys and trainer questionnaires.
- Sharing this website with our OTIEC partners.

The screenshot displays the EXTENSION website dashboard. The top navigation bar includes the logo and links for Home, Dashboard, and My courses. A sidebar menu on the left lists various course categories, with 'Focus Four' currently selected. The main content area is titled 'Focus Four' and contains a descriptive paragraph about the slide sets. Below the text, there are two expandable folders: 'Caught In or Between' and 'Electrocution'. Each folder contains a list of documents, including student activities, a PPT, and a lesson plan. 'Download folder' buttons are visible next to each folder.

Next Steps

- Disseminate the training material.
- Complete analysis of data collected:
 - Compare what the trainer reported that their training preferences are with what they actually do while training across multiple classes
 - Compare what the trainers reported they did with what the students reported was done
 - Determine if the learning objectives were met with the analysis of the pre- and post-knowledge assessment
- Publish the results
- Meet with OSHA about adopting.
- As an OTIEC, we will provide this new material to our existing and new OSHA 500 students.
- Encourage other OTIECs to do so as well.

Enhancing the Long-Term Acceptance, Usability, and Effectiveness of Passive Exoskeletons among Construction Workers who Vary by Sex, Age, and Injury Status.

Burden of MSDs among Construction Workers

Construction workers continue to experience high rates (32.5 per 10,000FTEs) of work-related musculoskeletal disorders (WMSDs) - 11% higher than all other industry sectors in 2016^{1,2}.

The back and the shoulder were the most impacted body regions

Back injuries account for 43% of all cases, with a median of 8 lost work days¹.

Shoulder injuries account for 16% of all cases, with a median of 25 lost work days¹.

1. Bureau of Labor Statistics. Nonfatal Occupational Injuries and Illnesses Requiring Days Away from Work. 2018.

2. Wang X, Dong XS, Choi SD, Dement J. Work-related musculoskeletal disorders among construction workers in the United States from 1992 to 2014. *Occup Environ Med.* 2017;74(5):374-380.

Background

- Occupational exoskeletons may reduce the risk of WMSDs
- EXOs have been shown to lower muscle activity of the shoulder¹
- EXOs have been used on manufacturing lines such as in the automotive industry

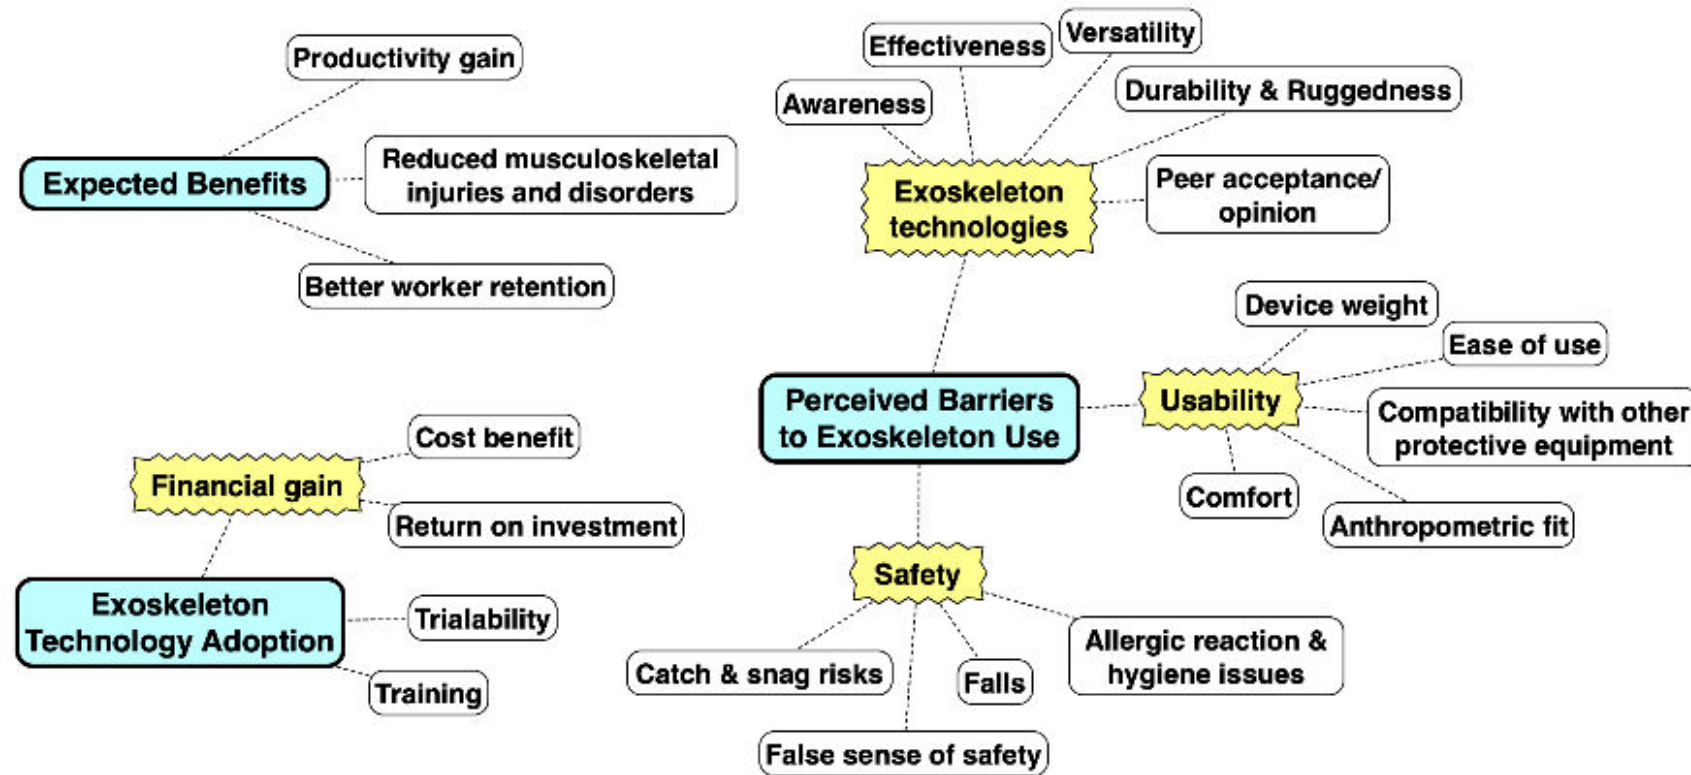

Variations in construction tasks, environments, companies, and worker demographics present challenges to the implementation of ASEs.

Van Engelhoven L, Poon N, Kazerooni H, Rempel D, Barr A, Harris-Adamson C. Experimental Evaluation of a Shoulder-Support Exoskeleton for Overhead Work: Influences of Peak Torque Amplitude, Task, and Tool Mass. *IIEE Transactions on Occupational Ergonomics and Human Factors*. 2019;7(3-4):250-263.

MORE INFORMATION

Quick Tips

ARM SUPPORT EXOSKELETON SET UP GUIDE FOR CONSTRUCTION

When performing **overhead tasks**, consider setting the exoskeleton to **100%** of your arm and tool weight (visit www.tiny.url/exofit).

When performing **forward reach tasks**, consider setting the exoskeleton to **75%** of your arm and tool weight (visit www.tiny.url/exofit).

You will need **extra clearance and time** to maneuver through scaffolds or other constrained spaces.

Balance is minimally impacted while walking, even on beams, whether the device is on or off.

Be **CAUTIOUS** when wearing an Exo while climbing as it can impact your sense of balance and safety when reaching overhead.

Visit www.tiny.url/exofit to generate your individualized support settings based on your sex, height, weight, type of exoskeleton, and task that you will be performing.

Understanding the drivers of and barriers to adopting passive back- and arm-support exoskeletons in construction: Results from interviews and short-term field testing

Mohamad Behjati Ashtiani^a, Wallace Morris^b, Aanuoluwapo Ojelade^b, Sunwook Kim^a, Feyisayo Akinwande^a, Alan Barr^c, Carisa Harris-Adamson^{c,d}, Abiola Akanmu^e, Maury A. Nussbaum^{a,*}

Enhancing Long-Term Acceptance, Usability, and Effectiveness of EXOs in Construction

Aim 1

Develop and evaluate effective training protocol

Aim 2

Determine the medium-term (2-4wk) effectiveness in diverse trades and populations

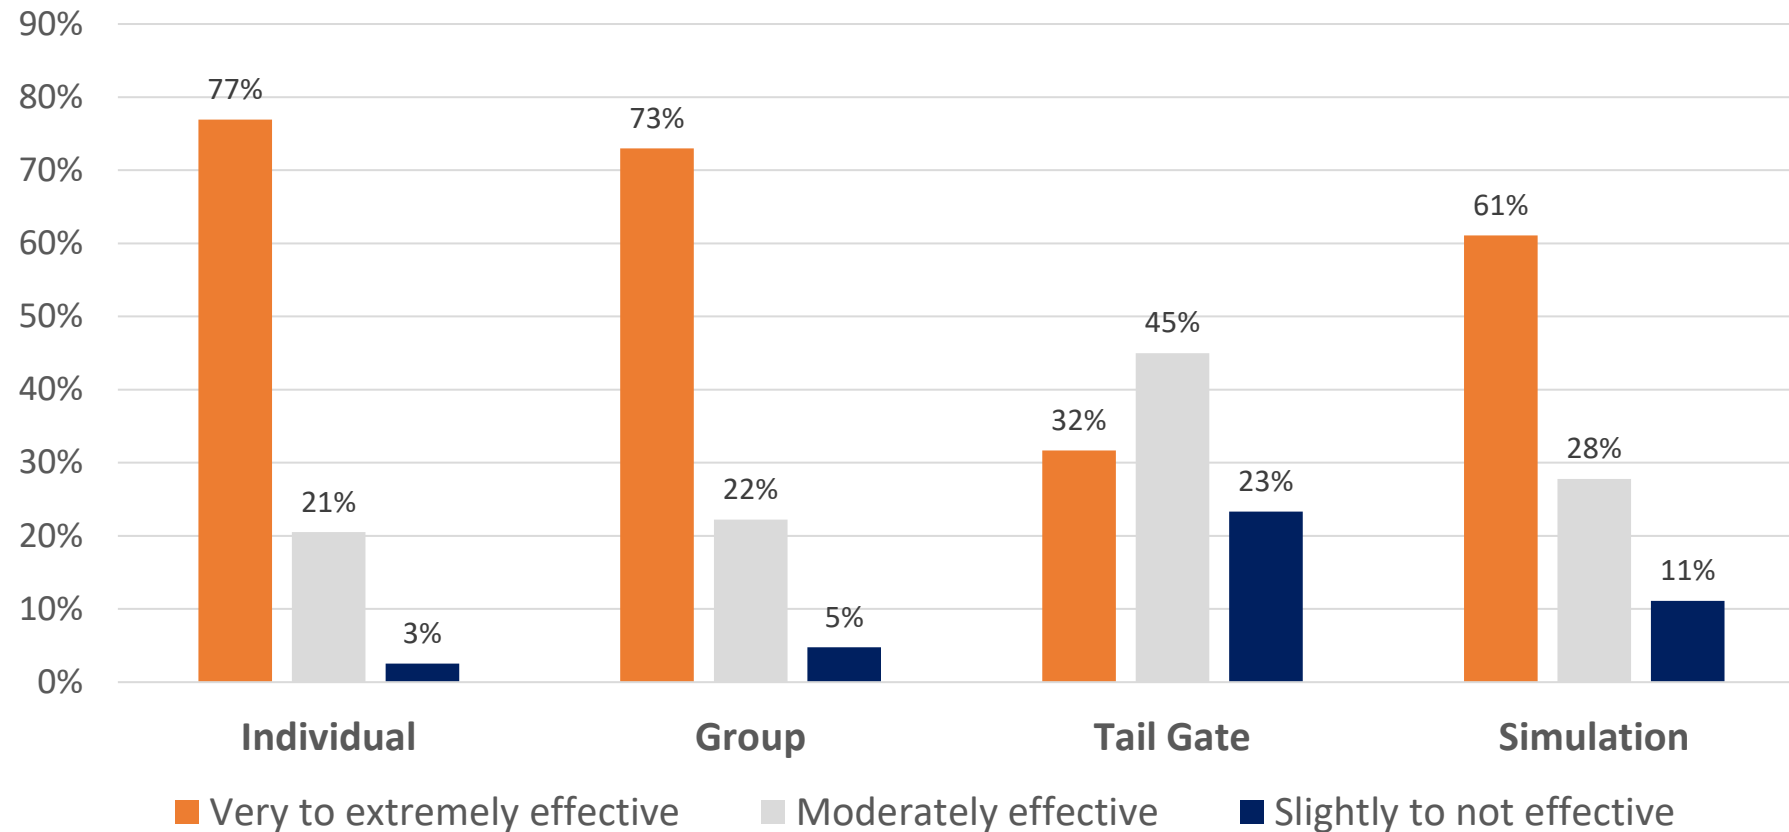

Aim 3

Determine the long-term (3-4 months) effectiveness in diverse trades and populations

Effectiveness of Training

Effectiveness of Training when Trying New Tools

Training Materials in Development

- **Goal:** Safe, effective exoskeleton use
- **Training Modes**
 - In-person sessions (hands-on)
 - Online modules as a reference
 - Online modules alone
 - Safety Personnel
 - Construction workers
- **Online Platform**
 - Articulate Rise 360
 - Benefits: flexible, accessible, practical learning

Core Training Modules

**Essential topics for
effective, safe
operation:**

- **What and EXO is & what it Does (Purpose)**
- **Passive Exoskeleton Overview (Components & Design)**
- **Use Cases**
- **Fitting & Adjusting (Comfort & Effectiveness)**
- **Setting Support Levels (Tailoring Assistance)**
- **Removing the Exoskeleton (Doffing)**
- **Safety Information (Critical Guidelines)**
- **Summary & Next Steps**
- **FAQ**

Creating the Interactive ASE Guide

Ekso EVO User Guide- 04/22/2025 Current Version

START COURSE

Arm Support Exoskeleton Fit and Support Level Estimator

Exoskeleton Make:

Preferred Activity:

Your Height (cm):

Your Weight (kg):

Your Sex:

Get Recommendation

Support Level Setting:

Shoulder Breadth Setting:

Arm Length Setting:

Waste Setting:

Spine Length Setting:

Arm Cuff Size:

The Ekso EVO User Guide will teach you to adjust the exoskeleton for optimal performance and stay safe while using your new tool. Before we begin, grab your exoskeleton and get ready to follow along in adjusting the settings, trying on, and testing the Ekso EVO.

Assessing Understanding & Proficiency

- **Assessment ensures trainee competence & confidence**
- **High-Level Evaluation Categories**
 - *Knowledge*: Recall facts, explain concepts
 - *Application*: Describe/demonstrate proper use
 - *Attitude/Value*: Understand safety importance, feel confident
- **Specific questions developed to evaluate each category**

Evaluating the Trainings

| | User Guide | Hilti Exo S |
|-----------------------------------|--|--|
| Learnability | Correctly identify different parts of the Exoskeleton | Proper adjustment of the exoskeleton was achieved without intervention |
| Efficiency | Total time to complete User Guide | Total time to don, doff, and adjust to user-specific measurements |
| Memorability | Score on five-question quiz given after guide completion | Proper adjustment and fitting were achieved without intervention |
| Errors | Errors made while navigating the User Guide (misclicks) | Total Errors made while adjusting and donning the exoskeleton |
| Satisfaction and Usability | SUS Score for the User Guide | SUS Score for the exoskeleton |

Evaluation Methods

- **Intermittent training module questions (quiz)**
 - Pre-training: Baseline knowledge
 - Post-training: Knowledge gain & comprehension
- **Self-Assessment**
 - Pre-training: Perceived confidence/skill.
 - Post-training: Shift in confidence post-training & initial use.
- **Questionnaires**
 - After training & initial use: Feedback on material quality/relevance.
- **Brief Interview**
 - After training & initial use: Understanding specific challenges.

Current Partners

- **At UCSF/UC Berkeley**
 - Northern Cal. Labor Training Center
 - LiUNA!
 - Local companies of various sizes
- **At Virginia Tech**
 - Allan Myers, Inc.
 - Skanska

LiUNA!

SKANSKA

Timeline

- **Completed:**
 - IRB approval obtained
 - Exoskeletons purchased
- **June:**
 - Evaluate the training and approach
 - Finalize training and evaluation materials
 - Recruit additional partners
- **July-August:**
 - Data Collection
 - Data Analysis
 - Reporting

THANK YOU!

Preventing Suicide and Promoting Mental Health in Construction Workers

Bradley Evanoff, MD, MPH

Ryan Lindsay, MSW, LCSW

Sami Tayeb, MA

Healthy Work Center

Research to Practice Workshop
June 4, 2025

Study Aims

- **Adapt** the Australian suicide prevention program “MATES in Construction” for application in the US construction industry to improve awareness, help-seeking, help-offering, & referral
- **Implement** the program in six regional construction companies
- **Evaluate** changes in worker attitudes, program implementation, and perceived effectiveness
- **Disseminate** the program to reach a wide audience in the industry

Study Rationale

- Construction workers have >two-fold excess risk of suicide compared to other male workers
- Construction workers are approximately five times more likely to die from suicide than from a workplace injury
- Organizational and cultural factors in construction increase the risk of mental health problems
 - Long working hours, precarious work, high injury rates
 - Cultural norms and stigma inhibit help-seeking
 - Highly fragmented health care

Australian MATES in Construction Program

MATES Trust: provides referral, case management, worker training

Level 1: General Awareness Training (GAT): 1-hour annual training to all workers on site: increase awareness, willingness to seek help

Level 2: Peer Connector Training: 5% of workforce receives 4-hour training – train peers to increase help-seeking, help-offering; “hand off” workers in crisis

Level 3: Applied Suicide Intervention Skills Training (ASIST): 2-day training for employees of the MATES trust who provide evaluation and referral

Goal 1: Adapt the MATES program

- Implement key elements of the MATES program within contractors - (without a well-funded independent trust and a national health care plan!)
- Many discussions with contractors
- Assess Organizational Readiness for Change
- Provide level 2 and 3 training through cooperation with LivingWorks
- Provide options for Level 1 training: one-hour training or via 5 toolbox talks
- Document & publicize available resources; referral pathways for workers with different health benefits

Tarlton Pilot Program*

- Two-day ASIST training for HR & safety managers in August '23
- Half-day safeTALK Training for Peer Connectors in October '23
- General Awareness Training for all workers: Five days of TBTs in Sept '23
- Hard Hat Stickers; resource cards
- Final TBT promoting the program: Jan. 2024
- Interviews with trained personnel: March-May 2024

Scan the QR code to learn more
in the May CPWR report

*Supported by CPWR small grant

Study Updates

- Partnered with Emery Sapp & Sons and Icon Mechanical.
 - Strong support from company leaders
 - Working closely with their safety teams and HR benefits personnel
 - Both have completed LivingWorks ASIST and safeTALK trainings
 - Signed contractor agreements
- Implementation and Evaluation goals of the study have been approved by WashU's IRB
- Implement evaluation of general awareness training at each company beginning in June

Contractor Profiles

Emery Sapp & Sons

- Road construction
- Employee owned
- Company has approximately 1,500 workers
- Operations in Missouri, Arkansas, and Kansas
- Recently won bid for I-70 expansion project

Icon Mechanical

- HVAC, Industrial ventilation, Piping
- Pipefitters, Sheet Metal workers, several other trade unions
- Company has several hundred workers
- Operations in Missouri, Illinois, and Tennessee

Evaluation

- 10-question mobile phone survey before GAT training, then 1 week and 3 months after
- Document changes in attitudes, help-offering, help-seeking
- Interviews to assess success of implementation
- Proctor Implementation Framework
 - *Acceptability, Adaptation, Appropriateness, Feasibility, Fidelity, Implementation Cost, Penetration, Sustainability*

Future Plans

- Plan A – CPWR funded for year 2 – stay ahead of schedule, aim to complete implementation/ evaluation in 4+ contractors
- Plan B – CPWR not funded for year 2 – curtail new recruitment of study sites, pivot to early dissemination
 - Inform larger national suicide prevention efforts based in NABTU, AGC, AFSP
 - Empower individual contractors, unions via a new “Playbook”

Suicide Prevention Playbook for the Construction Industry

- Disseminate a “playbook” to interested contractors and unions
- Based on experiences to date
- Tips on how to do:
 - General Awareness Training (options)
 - Work with LivingWorks
 - Set up other program elements
 - Annual refresher trainings
- Tracking & evaluation

Suicide Prevention Training Playbook for the Construction Industry

The COMPASS (Construction Organizations Mobilizing to Promote and Assist Suicide Safety) program was developed to meet the unique needs of the US construction industry, and it aims to help people in the construction industry assess, develop, and strengthen their suicide awareness and prevention programs. This playbook was developed by university-based Healthy Worker programs in Missouri and Iowa with the active support of contractors, labor unions, and the Missouri AGC. The program is meant to provide construction contractors with an adaptable blueprint to implement and maintain a suicide prevention training program for their workforce.

The COMPASS program was inspired by the “MATES in Construction” program, which is an evidence-based suicide prevention program initially implemented in the Australian construction industry, and has since been expanded to New Zealand and the mining, energy, and manufacturing industries. COMPASS adopts key elements of the Australian framework, including three levels of suicide prevention training (see fig. 1). The first is a general awareness training (GAT) for suicide prevention that everyone in the company receives and is delivered either in the form of five toolbox talks or a 1-hour presentation. The second is training volunteer peer connectors (safeTALK) who connect their coworkers with help. The third is an Applied Suicide Intervention Skills Training (ASIST) for additional personnel who work with peer connectors to provide further evaluation and referral to workers in need of help. The goal of these three levels of training is to encourage workers to seek help for mental health issues and to establish a peer-based ‘gatekeeper’ network on construction worksites, where workers are encouraged to offer help to co-workers in need.

The COMPASS program has been successfully implemented at multiple construction sites in conjunction with support from a university-based team. This playbook offers a multi-step guide for contractors to implement and sustain a similar suicide prevention program within their own companies.

Mentoring SMART Women:

A coordinated approach to supporting safety, health, and wellbeing: study update

Dr. Marissa Baker, Principal Investigator

Department of Environmental and Occupational Health Sciences, University of Washington

CPWR Research to Practice

June 4, 2025

Agenda for Today

- > Refresher of study background
- > Activity and outputs in NCE year
- > Mentorship resources

Study Background

- > **Tradeswomen are at higher risk for a variety of psychosocial and physical risk factors on the job than their male counterparts**
- > **Pilot research with Washington Women in the Trades identified mentorship as an intervention strategy to offer empowerment and skills to apprentice tradeswomen through targeted support from experienced journeywomen**
- > **Partnership with SMART International, support from CPWR**
- > **Part of NABTU's efforts to improve working conditions for female construction workers**

NCE Year Activity

- > Promoted and disseminated training, mentorship resources at TWBN 2024 in New Orleans
- > Shared final mentorship training materials with control locals
- > Conducted interviews with mentors, mentees, and project coordinators
- > Completed Best Practices Guide to support future mentorship efforts
- > Published *Factors associated with construction apprenticeship completion in the United States* (November 2024) in the Labour and Economic Relations Review

Photo courtesy of SMART International

r2p outputs from our project

- > Asynchronous online mentorship training**
- > Mentor workbook**
- > Synchronous facilitation guides**
- > Skill-based videos**
- > Program evaluation guide**
- > Best practices guide for implementing a mentorship training**
- > 2 manuscripts in preparation, 1 in revision**

Refresh: Asynchronous Mentor Training

Video, text, and audio elements
15-25 minute sections

Relationship Building

Goal Practices

Active Listening

- Introduction
- What Is Active Listening?
- Active Listening In Action
- Active Listening, Step By Step
- First: Connect**
- Second: Clarify
- Third: Validate
- Blocks To Active Listening
- Drilling Down: Communicating Effectively
- Review

First: Connect

Connecting means giving your full attention to the conversation. This can be hard, but it might be the most important part of active listening.

Most times as listeners, our attention is somewhere else. But when listening actively, we give *all of our attention* to the speaker. This tells the speaker that what they're saying matters, and we're interested in what they have to share.

So, how do you do this?

- Check Your Surroundings**
It helps to first choose the right setting. **Try finding a place that is as distraction-free as possible as possible.**
Remember how Val called Kendra from her car, so it could be quiet and private? This gave Val a better chance to connect with Kendra than if she tried to call from the worksite, where there was a lot of background noise.
- Show You're Interested**
You can also use **body language** and **voice** to show that you're interested.

Best Practices Guide

4. What Makes a Good Mentor

Overview:

While there is no one quality that makes a successful mentor, particularly for mentors who are new or have not held other mentor-adjacent roles in the trades or other areas of life, there are certain attributes to consider during recruitment. Keeping these in mind as you help potential participants determine if they would be a good fit for the role can help you screen for candidates that will be successful. The following list is not exhaustive but intended to be used as a foundational guide.

Mentor Qualities:

1. *Desire to support future tradeswomen*

In articulating their desire to step into a mentorship role, **look for mentor candidates who talk about their interest to either “pay forward” similar support they received early in their career or improve the culture of support they wished they had had entering the profession.** It is important to consider that many mentorship positions are unpaid and require added labor on top of full-time jobs and demanding personal lives. Finding mentors who can sustain a commitment to the program is critical. The desire to reduce barriers for those earlier in their career and make the trades a more welcoming and supportive space for new tradeswomen is often an excellent motivation and can be predictive of longer-term success and satisfaction in the program.

2. *Strong Communication*

While communication skills can be enhanced, it is ideal for mentors to enter the program with strong communication skills and the ability to reach out and readily connect with mentees. This quality is particularly important in mentorship programs where a majority of the communication does not take place in person. A mentor’s ability to successfully build connection and support to mentees via phone, text, and/or video chat can require an extra degree of skill. When recruiting, it might be helpful to assess mentors’ communication skills in a variety of ways through an email or text communication, informal in-person conversation/interview, and/or a video or phone call.

3. *Experience in the Trades*

1. Overview Section

2. Recommendations for implementation

Reflections from our mentorship study:

With our cohort of mentors, the common denominator across fully engaged mentors was a desire to make the trades a more welcoming space for new tradeswomen. Every mentor had stories that illustrated their own journey toward “making it” in the trades as successful journeywomen: this involved strategies to overcome discrimination, harassment, and tokenism that comes with being a woman in the trades. While mentors often shared that there is a mentality in the trades of putting up with harassment or aggression on the job as a kind of rite of passage, many mentors expressed desire to break this cycle through more supportive programs for tradeswomen, like mentorship.

While we did not require all mentors to be women, our cohort was majority women (one male mentor participated.) Having your mentors share the gendered experience of your mentees creates a sense of camaraderie and shared experience among dyads; however, trust is often the biggest factor in determining the success of a pairing: men can be excellent mentors for the right tradeswoman mentee. If you do decide to open up the mentor role to all genders, we would recommend having mentees preference whether they would like a tradeswoman mentor, or if they are open to working with a tradesman. This ensures that all participants feel comfortable with their matches.

3. Lessons learned from mentorship study

Mentor Handbook

Section 3 Goal Practices

Goal Practices are small, measurable steps you can take on a daily basis to work toward a larger goal. Helping your mentee identify long-term goals—and goal practices to help them get there—provides structure for your weekly check-ins.

Understand Goal Practice

Step 1: Identify Long-Term Goals

What is your mentee excited to learn more about? What are they struggling with, that they'd like to improve on? This is the first step before breaking it down into goal practices.

Step 2: Assess Mentee's Progress

How much progress has your mentee already made toward their goal? Ask your mentee questions to see where they're at.

Step 3: Continue, Stop, Start

Continue: What practices are working for your mentee?

Stop: What practices aren't working for your mentee?

Start: With the information above in mind, are there new practices that would be helpful?

Step 4: Review the Plan

Summarize the discussion: what is your mentee's current goal, and what practices are they going to continue, stop, and start? It's also a good idea to set up your next check-in at this time to assess progress and provide support as needed.

Summaries of each module in self-paced, online training

Mentoring SMART Women: Program Goals

This program aims to develop leadership and communication skills in mentees through the support of experienced, journey-level mentors like you. Our goal is for mentees to feel more empowered on the job and, in the long term, make the trades a more inclusive space for women. The diagram below represents how we envision this process, from mentor to mentee.

PAGE 10

Second and Third Meetings:
Establishing Expectations

Your second and third meetings are a great time to set the tone and establish expectations for your communication with each other. This document is designed to guide you through establishing communication norms. You can also use this as a reference point to review and modify as your relationship and schedule evolve over time. Below are some questions for you to review with your mentee. To note: if you have more than one mentee, you may find your answers may differ for different partnerships based on each person's unique schedule.

DATE: _____

Mentor's Name: _____

Mentee's Name: _____

1. What are our shared communication goals?

Mentors: how will you show your support?

Mentees: What kind of support do you want from your mentor?

Both of you: What is most important to us in this relationship?

2. When will we touch base?

At the beginning of your relationship, we ask that you touch base at least once a week. Find a check-in time that works for both of you.

Day of the week: _____ at _____ (time of day).

Back up time:

Day of the week: _____ at _____ (time of day).

Page number

Understanding the Effectiveness of OSHA Construction Consultations in Reducing Serious Hazards

Wayne Gray

Professor of Economics, Clark University

John Mendeloff

Professor of Public Affairs Emeritus, University of Pittsburgh

2025 CPWR r2p Seminar & Partnership Workshop

June 4, 2025

OSHA Consultation Programs – Big Variation across States

State Plan states and Federal states

OSHA State Consultation Programs

- Separate programs in each state
- Mix of federal and state funding (10% minimum state contribution)
- Considerable variety across states in funding and activity levels
 - 19 states always contributed 10%; 6 states averaged 50% or more
 - Visits per 1000 employees: 6 states less than 0.2; 5 states more than 4.0
- Voluntary program - Employer submits request for visit
- Agrees to correct any violations of OSHA standards identified on visit
- State consultant visits worksite, provides report on hazards found
- Reports are confidential – not passed on to enforcement
- Relatively small program – 47,418 construction visits 2016-2022
- Smaller than enforcement – 224,736 OSHA inspections in construction
- Little research on OSHA consultation impacts – none in construction
 - Read (2017), Wurzelbacher et al (2023), Mendeloff and Gray (2002)

State Policies and Construction Fatality Rates in the US

- Large differences in state-level construction fatality rates
- State-level policy differences:
 - OSHA enforcement - inspection rate and average penalties
 - OSHA consultation - visit rate
 - Workers Compensation - small-firm exemptions, longer waiting period
- Significant negative coefficient on consultation visit rate
 - More visits associated with fewer fatalities
- Relationship stronger for State Plan states
 - (States decided – in 1970s - to administer their own OSHA enforcement)
- Wayne Gray and John Mendeloff, “Preventing Construction Deaths—The Role of Public Policies”, Regulation and Governance, vol 17(3), July 2023, p. 726-754.
<https://doi.org/10.1111/rego.12486>.

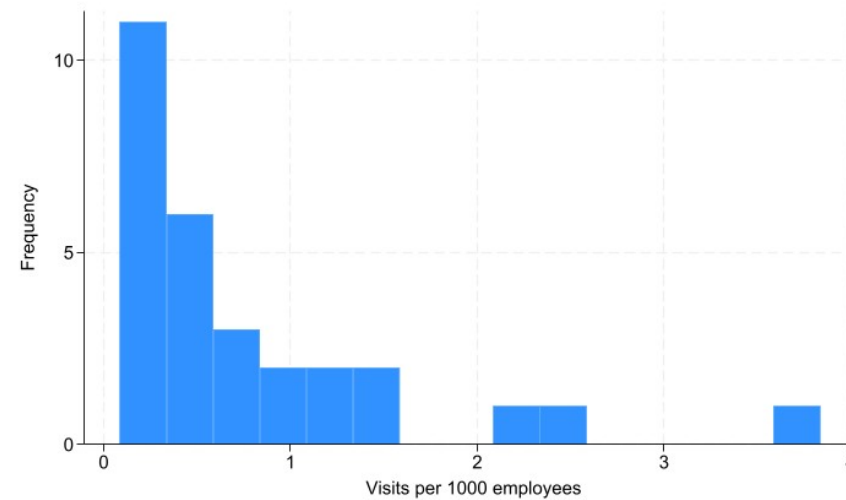

Variations in States' OSHA Consultation Programs - Process

- 1. Examined OSHA's OIS database on consultations during 2016-2022
 - Variations across states in numbers of consultations and % in construction
 - Variations in consultation characteristics
- 2. Interviewed 31 states' Consultation Program Managers
 - All 21 State Plan states plus 10 Federal OSHA states
 - Details of program structure and activities
- 3. Connected interview responses to state characteristics in OIS data

Variations in States' OSHA Consultation Programs – Visit Frequency

- As a group, State Plan states averaged higher construction consultation rates than Federal states, but also showed more variation across states. Nearly all the high-rate states were State Plan, but some State Plan were below-average.

- 21 State Plan States (mean 1.6)
(Rates truncated at 4 = MN, WA, SC, AK, VT)

- 29 Federal States (mean 0.5)
(Maximum 3.7 = OK)

Variations in States' OSHA Consultation Programs – Visit Intensity

- Visits can be Full (whole worksite) or Limited (specific hazard)
- Related to average number of serious hazards detected per visit

State Plan states and Federal states

Variations in States' OSHA Consultation Programs – Regression Analysis

- Regression analysis – factors affecting construction workplace fatality rates
 - Annual state fatality rate in construction, 1992-2016
 - Main focus on state consultation programs
 - Also includes workers comp, enforcement inspections
 - Other state characteristics
- Similar to prior analysis – but now including state visit intensity
 - Average hazards per visit; average serious hazards per visit; hours per visit
 - Multiply average intensity times annual visit frequency rate
- Fatality rates are lower in states with:
 - Higher consultation visit rates in construction
 - More intense consultation visits (more hazards cited, longer visits)

Variations in States' OSHA Consultation Programs - Results

| | All States | State Plan | Federal |
|-------------------------|------------|------------|----------|
| Consultation Visit Rate | -4.595** | -5.651*** | -2.918 |
| Visits*serious hazards | -1.639*** | -1.432** | -2.466* |
| Visits*total hazards | -1.442*** | -1.331** | -2.531** |
| Visits*visit hours | -0.349** | -0.335** | -0.387 |

Variations in States' OSHA Consultation Programs - Next Steps

- Additional data analysis
- What's new?
 - Getting detailed OSHA consultation data for 1992-2024
 - Wide range of workplace hazard measures:
 - BLS data (CFOI fatalities + SOII injuries)
 - OSHA violations and hazards, some injury data
 - Firm-level identifiers to link together data on hazards and consultations
 - More advanced statistical analysis to establish causal connections

Summary

- Variation across states in construction fatality rates
- Several factors are associated with lower state fatality rates
- One factor is OSHA Consultation Program activity
- Substantial variation across states in visit frequency and intensity
- Differences between State Plan and Federal OSHA states

- Goal – provide information to help Consultation Programs
 - Allocate existing resources
 - Possibly justify additional resources

Research to Practice Program Progress

September 2024 – June 2025

Jessica Bunting, MPH

Grace Barlet, MPH

Rosa Greenberg, MPH

Chris Le, MPH

JoyLynn Keeton

Providing ongoing r2p guidance and support

- ✓ Continued the r2p Roadmap/researcher touch-base process with all Consortium researchers during February and March 2025
- ✓ Published a cut-off saw factsheet started by the NORA CSC
- ✓ Served on the Northeast Center of Occupational Health and Safety's r2p Advisory Board to help share lessons learned in construction r2p with the farming and fishing industries

II. SILICA INHALATION

Dust created by cut-off saws is a potential health hazard. Concrete cutting with hand-held saws can produce elevated concentrations of respirable dust, a portion of which is composed of respirable crystalline silica (RCS). Repeatedly breathing too much of this dust can eventually lead to silicosis, lung cancer, chronic obstructive lung disease (COPD), and decreased lung function. The dust can be a hazard not only to the saw operator but to other nearby workers.

OSHA estimates that 2.3 million million construction workers... A recent study found that of the 1 (REL), 79% worked in the constr... OSHA's Respirable Crystalline S...

POTENTIAL HAZARDS

I. SAFETY ISSUES

Cut-off saws have different types of cutting or abrasive blades for wood, metal, and concrete. Blades are typically diamond.

The primary safety hazards with these saws arise when they pinch or bind in the material being cut. This can result in serious injury.

There are three main types of reactive forces operator

- **Pull-away** – The saw moves forward, away from the operator.
- **Climbing** – The saw lifts slightly and tries to “climb” up the material.
- **Rotational kickback** – The most dangerous, occurs when the saw binds and is thrown backward toward the operator.

Pull-away and climbing forces can often be controlled by the operator. However, rotational kickback is a violent force when the saw binds. In addition to pinching or binding in the material, kickback incidents include sideloading (too much pressure to the side of the cutting material, and cutting with the upper quadrant of the blade).

Surveillance data of injuries from use of cut-off saws in construction are grouped together regardless of type. A review of “cut-off saw” injuries from the Occupational Safety and Health Administration (OSHA) records (NAICS 23) revealed 39 records of severe cut-off saw injuries from available OSHA Investigation Summary Case reports from available OSHA Investigation Summary Case reports. For example:

- **In May 2020**, an employee was using a cutting saw to cut a pipe and kicked back landing on the foot of the employee. The employee received medical treatment for the injury.
- **In October 2022**, an employee was working for a contractor and was using a cut off saw to cut pipe and when the pipe kicked back the employee was pulled into the rotating saw. The employee was injured.

CPWR THE CENTER FOR CONSTRUCTION RESEARCH AND TRAINING

HAND-HELD CUT-OFF SAWS IN CONSTRUCTION: PROPER USE AND TRAINING NEEDED FOR POWERFUL TOOLS

A CPWR fact sheet developed with support from the NIOSH-NORA Construction Sector Council

Construction workers rely on a variety of hand-held power saws to cut through tough materials like tile, brick, stone, concrete, steel, and iron. Among these cut-off saws, also called concrete saws, abrasive saws, and quick-cut saws are among the most powerful and widely used. These high-speed tools make demanding cuts possible, but if not handled properly, they pose serious risks.

CPWR's review of OSHA's Fatality Inspection Data revealed numerous fatalities and serious injuries involving cut-off saws, highlighting the severe risks of improper use. These tragedies serve as a stark reminder of the importance of proper training, implementing safe operating procedures, and strict adherence to the manufacturer's instruction manual.

Struck-by incidents, including those caused by saws, are the leading cause of non-fatal traumatic injuries and the second leading cause of fatalities among construction workers. Some hand-held cut-off saws pack over 7 horsepower, generating extreme cutting force. One wrong move can result in serious injury or sometimes death. The saw's high-speed rotation creates multiple reactive forces, increasing the risk of sudden kickback, blade pinching, or material ejection. If the tool is used improperly, the saw itself, or the material being cut, can become a deadly projectile.

But the dangers don't stop there. For example, cutting silica-containing materials produces respirable crystalline silica dust, a hazardous airborne contaminant. Prolonged exposure can lead to silicosis, an irreversible and potentially fatal lung disease.

****This Fact Sheet provides essential safety information on proper cut-off saw operations to help prevent struck-by injuries, fatalities, and exposure to hazardous silica dust. With cut-off saws, there's no room for error.**

- ✓ Worked with Struck-by Work Group, ARTBA, and other partners to plan for the 2025 Stand-Down (April 21 – 25)
- ✓ Developed a Save-the-Date graphic
- ✓ Promoted through social media, websites, newsletter, etc.
- ✓ Held a Stand-Down webinar with ARTBA and OSHA

National Falls Campaign & 2025 Stand-Down

- ✓ Worked with Falls Work Group, OSHA, and other partners to plan for the 2025 Stand-Down (May 5 – 9)
- ✓ Developed a Save-the-Date graphic
- ✓ Promoted through social media, websites, newsletter, etc.
- ✓ Designed & distributed over 275,000 hardhat stickers
- ✓ Distributed over 203,000 hazard alert cards
- ✓ Held 2 webinars
- ✓ Registered 48 Premier Partners (compared to 24 in 2024)
- ✓ Completed the 2024 OSHA Certificate of Participation analysis & report
- ✓ Developed surveys for an in-depth Falls Campaign evaluation

THE CENTER FOR CONSTRUCTION
RESEARCH AND TRAINING

R2p Program Highlights

2010 – 2025

Jessica Bunting, MPH

CPWR Research to Practice (r2p) program director

jbunting@cpwr.com

The Evolution of CPWR's r2p Program

2010 – 2014: Developing an r2p infrastructure

- Developed r2p processes (specific tools and approaches for dissemination)
- Established partnerships and networks

2014 – 2019: Developing more integrated systems

- Focus on both “push” and “pull”
- Better linkage between researchers & industry

2019 – 2024: Conducting r2p evaluation & translation research

- Are our methods and resources effective?
- What lessons learned can we share with the industry and other researchers?

2024 – 202?: Expanding our impact across the industry

- How can we improve what we're already doing (e.g., reaching small businesses, Spanish translation, the Falls Campaign)?

The Evolution of CPWR's r2p Program

2010: CPWR established its r2p program at the National Academies' recommendation

2012: Falls Campaign began

2014: Established model **r2p Roofing Partnership & Trainers and Researchers United Network (TRU-Net)**

2015: First **annual r2p seminar & partnership workshop**

2015-2019: Established an **Ergonomics Community of Practice & Roundtable on Reaching Vulnerable Workers**

Evaluated mechanisms developed in first cycle (triage, roadmap, TRU-Net)
Developed an online **Safety & Health Network**

2020-2022: Responded to the **COVID-19 pandemic** by developing 2 websites & numerous resources

2010: Established the **CPWR-NIOSH-OSHA r2p Working Group, Model Masonry r2p Partnership**, and 2 temporary **Latino Fall Prevention partnerships**

2015: Published version 1 of the **Partnership Toolkit**

2016: Started CPWR's **webinar series**

2010-2014: Developed & used the **Triage Tool** to ID r2p-ready projects

Developed & implemented version 1 of the **r2p Roadmap**

Conducted research on **Technology Transfer** & developed guides on best practices

2019-2024: Evaluated the r2p Roadmap process for **impact on industry adoption**

Completed a **developmental evaluation** of Best Built Plans

Pilot tested use of **nudges/behavioral economics**

Used & evaluated an expert panel based on the **Delphi Method**

Evaluated the **effectiveness of safety & health training programs** as a dissemination tool

Outputs & Outcomes

I. Partnerships & Networks

- Continued facilitation, leadership, and involvement in various formal and informal partnerships and networks
- Key for R2p & p2r

II. Tools & Support for Researchers & r2p Professionals

- Library of r2p tools and resources to support dissemination planning, technology transfer, and program evaluation
- Continued r2p Roadmap development and support
- Providing connection where possible (I)
- Resource development based on researchers' findings (III)

III. Research-Based Resources for Contractors & Workers

- Training & Awareness Programs
- Webinars
- Worker Handouts
- Planning Resources

IV. Social Marketing Campaigns

- CPWR leadership or organizational support

Partnerships & Networks

Interagency Work Groups & Alliances

OSHA-NIOSH-CPWR r2p Working Group

OSHA-CPWR Ambassador Alliance

NORA Construction Sector Council and Work Groups

Annual r2p Seminar & Partnership Workshop

CPWR-ASSP Alliance

Using Delphi Panels to Assess Construction Safety Research to Practice: A Narrative Review

PROGRAM EVALUATION

Center for Construction Research and Training
Delphi Method for Construction Safety and Health Research

Group of researchers in the fields of forecasting and planning at the RAND Corporation.¹ Since then, the Delphi method has become a standard tool for reaching a consensus among a panel of experts for addressing a complex problem.² It relies on an iterative process of feedback from panel participants. CPWR funded a literature review of the Delphi method for construction safety and health research.⁴ The review and a related report⁵ concluded the method can be used to identify and prioritize construction safety and health research priorities and putting research findings into practice.

Before using the Delphi method and what was learned through the literature review to answer the research question.

Delphi panels can be a useful approach for construction safety and health research when:
 - The problem is complex and the evidence is not clear.
 - It is difficult to collect or when empirical evidence is lacking.^{6,7}
 - The problem is not well understood and it is difficult to lend itself to precise analytical techniques but can benefit from subjective judgments on a number of issues.

Experts cannot be brought together in a face-to-face exchange because of time, cost, or other constraints.⁸

Researchers establish criteria for selecting "expert" panelists based on their research question. The selection criteria often include education, experience, size of organization, professional qualifications (e.g., certifications; members of national committees), and authorship of important papers. Researchers who did not list specific criteria in the studies reviewed tended to use purposive sampling techniques, noting panelists were qualified in their field and available to participate. When establishing criteria for selecting panel members for construction safety and health research, knowledge of the specific hazards or interventions under study and relevant job site characteristics may be equally or more important than criteria such as education or authorship.

Delphi panels can range in size from less than ten to hundreds of members due to several factors, including the scope or nature of the problem being investigated, the number of experts who are available, the resources that researchers can devote to the panel, and the diversity of the target populations.^{3,9} While the literature review did not identify an ideal size for Delphi panels¹⁰, those with experience applying it to construction research recommend a minimum panel size between 8 and 12 individuals.⁶

Multiple rounds of surveys and/or interviews are typically used to collect information from Delphi panelists. The approach and time between each round (e.g., one week, a month) depends on the researchers' time and resources and the approach that works best for the panelists.

How are panel members selected?
 How many iterations (surveys/interviews) are needed to achieve consensus?

Resources for Contractors & Workers

Developed based on:

- Current & completed CPWR, NIOSH, and university research
- NORA Construction Sector Council goals
- NORA CSC Work Group activities
- Social Marketing Campaign needs
- Priorities of other relevant partnerships & networks
- NABTU Safety & Health Committee requests
- Requests from other industry stakeholders
- Input & support from CPWR's Training Program
- Industry surveys
- OSHA regulation & consensus standard development

Training & Awareness Programs

TYPES OF HEAD PROTECTION

- **Hard Hat** is the common term in the construction industry.
- A **Helmet** is another form of head protection, which has a chin strap and may have other safety features.

Hard hat
Photo courtesy of Milwaukee Tools

Safety helmet
Photo courtesy of Milwaukee Tools

A bump cap *does not* provide the same protection as a hard hat or helmet.

CPWR [●] **Selecting Head Protection for Construction Work**
THE CENTER FOR CONSTRUCTION RESEARCH AND TRAINING

A traumatic brain injury (TBI) is an injury that affects how the brain works. It can be caused by a bump, blow, jolt, or penetrating injury to the head. TBIs can be mild, but more serious TBIs can lead to disability and even death.¹

Based on historical data, over 50,000 nonfatal work-related TBIs are treated on average annually in United States (US) emergency departments.² Nonfatal TBIs can be life-altering events; 43% of hospital patients treated for a TBI did not attend ordinary work for five years after their injury, which means these individuals were receiving a social transfer payment such as sickness absence benefits, experiencing short- or long-term sickness, or had died.³ Among all US industries, construction has the highest number of both nonfatal⁴ and fatal work-related TBIs. **Between 2003 and 2010, 2,210 construction workers died from a TBI.** These deaths represented 25% of all construction fatalities and 24% of work-related TBI fatalities among all industries during the same period.⁵ More recent data show a similar pattern, with 2,297 fatal intracranial injuries in construction from 2015 to 2022.⁶

Construction workers are at higher risk for TBIs because, in their work environment, they may be struck by falling or flying objects and may experience different kinds of slips, trips, and falls – from falls on the same level to falls from ladders and equipment to falls from multi-story buildings or scaffolding dozens of feet in the air. Over a third of all nonfatal work-related TBIs are attributed to falls, and among workers 55 years and older, the majority result from same level falls.⁷ **When it comes to fatal work-related TBIs, more than half are caused by falls, especially from roofs, ladders, and scaffolds.⁸**

Wearing protective headgear, such as a hardhat or safety helmet, is essential for reducing the risk of a TBI. A study by Kim et al. found individuals who had a work-related fall and were wearing a safety helmet were less likely to have head injuries compared to individuals who were not wearing a safety helmet.⁹ Protective headgear should be selected based on your trade, type of work, and work environment. **Rather than recommending a one-size-fits-all solution, the goal of this guidance document is to provide you with information on types of protective headgear, factors to consider, and additional resources.**

Acknowledgements
CPWR – The Center for Construction Research and Training would like to thank its [Expert Evaluation Panel on Construction Headgear](#) for their feedback throughout the inception and development of this document. In 2023, CPWR convened experts from academia, labor, government, manufacturing, and others to participate in an evaluation panel on the use of safety helmets with chin straps versus traditional hardhats. The goal of this expert evaluation panel was to: (1) assess industry awareness and adoption of ANSI/ISEA Z89.1 Type II protective headgear with and

BEST BUILT PLANS
BUILD SAFETY INTO EVERY JOB

CONTRACTOR TIP SHEET FOR SAFE MANUAL MATERIALS HANDLING
Improve Materials Handling Practices, Prevent Injuries, Save Money.

CPWR's Best Built Plans program helps contractors of ALL sizes plan ahead to prevent soft tissue injuries caused by manually lifting and moving heavy construction materials.

Sprains, strains, and other soft tissue injuries are common, painful, and expensive. They are a leading cause of disabling injuries suffered by construction workers and cost the industry billions EACH YEAR. Just one injury can cost your company thousands of dollars in lost productivity and higher insurance premiums.

They also create a financial burden for workers and their families, and worse, put injured workers who rely on pain medication to continue working at increased risk of addiction.

None of these outcomes are good for your business or your employees. Fortunately, how materials will be selected, delivered, stored, lifted, and moved BEFORE a job's start (along the way) can prevent painful injuries, give workers longer careers, and stay productive and profitable.

Use this guide to get started. For additional information on how to develop a plan to prevent manual materials handling injuries, visit bestbuiltplans.org or watch this [short \(6-minute\) video introduction](#) to the program and how to use it.

What are soft tissues injuries and what causes them?

JOB-RELATED FACTORS THAT INCREASE RISK OF HEAT-RELATED ILLNESS AND DEATH

Machinery, power tools, and hot/molten materials can radiate additional heat

Working in direct sunlight can increase heat exposure (and the risk of skin cancer!)

Physical exertion and heavy workloads generate heat in the body and cause fluids and electrolytes to be lost more quickly through sweat

Clothing and PPE can trap heat and reduce air flow, making it harder for the body to cool itself

Additional risk factors may include, but are not limited to: lack of acclimatization, working in enclosed spaces, and some medications, caffeine, or other individual factors

PROTECT YOURSELF AND YOUR CREW!

FALL PROTECTION: Leading Edge Safety Tipsheet

A **leading edge** is the unprotected side and edge of a floor, roof, or formwork for a floor or other walking/working surface (such as a deck) that changes location as components are added. It is called a **leading edge** because the location of the edge changes as workers add or construct additional floor, roof, decking, or formwork sections. When a leading edge is not actively and continuously under construction – and therefore is not moving, it is considered an “unprotected side or edge”.

Employers must protect all workers constructing a leading edge that is **6 feet or more above lower levels** from falling through use of passive engineering controls (e.g., guardrails, safety net systems) and/or active systems (e.g., travel restraint or personal fall arrest systems).*

Visit CPWR's [Tipsheet on Planning a Multi-Layered Approach to Fall Prevention and Protection](#) for more information on these and other controls.

When there is no overhead anchorage available on a leading edge, workers of tie off at foot level. If they fall, it causes lifeline to catch and pull taut on the leading edge. The positioning of the lifeline along the edge can also add increased force both the lifeline and the worker's body.

This can cause a standard lanyard or retracting lifeline (SRL) to break or bind.

Always work with your **competent person** to ensure the best fall prevention and protection. These may be the same person or two people who are capable of identifying and correcting fall hazards. A **qualified person** is approved to supervise fall protection and rescue systems.

*An exception to this rule occurs when the employer can demonstrate that the plan which meets OSHA requirements. For more information, visit www.osha-slc.gov.

PLANNING A MULTI-LAYERED APPROACH TO FALL PREVENTION AND PROTECTION

A recent CPWR survey identified insufficient or ineffective planning as the number one underlying cause of falls from heights. A lack of preparation can lead to a reliance on PPE as the only protective measure, but the survey also found that when employers didn't do any planning, the odds of workers using their fall protection equipment were 71% lower.¹

The table below is based on the hierarchy of controls. The top of the table represents approaches that result in the most risk reduction and the bottom represents approaches that result in the least risk reduction. Contractors, owners, designers, and others should use this chart, beginning at the top and incorporating controls as feasible to prevent falls.^{2,3}

| Eliminate or minimize the fall hazard | Elimination | Substitution | Prevent the fall | Active Engineering Controls | Administrative Controls | Minimize the impact of the fall | Personal Protective Equipment & Other Protective Measures |
|---------------------------------------|--|--|---|--|--|---|--|
| | Plan, design, install, or move equipment to eliminate or minimize hazards associated with working at heights. Use Prevention Through Design measures. Inspect and maintain equipment regularly to prevent failure. | Change the method of work to reduce the risk of falling. | Use passive fall prevention. | Use active fall prevention. | Establish and use safe operating procedures when working at heights and provide comprehensive training in a language understood by workers. | Supply and use personal protective equipment (PPE) such as a personal fall arrest system. ⁴ | Plan ahead to reduce the risk of injury or death if a fall does occur. |
| | | | Install temporary guardrails or barriers, including around skylights and holes. | Use fall restraint systems that secure workers via an anchor point, connector, lanyard, and harness to prevent the worker from reaching the fall hazard. | 1. Make sure a competent/qualified person is present on the job site. 2. Train workers for the specific task and unique fall hazards faced. | 1. Make sure fall harnesses fit workers properly. 2. Plan ahead with input from the competent or qualified person to ensure certified anchor points, lanyard type and length, etc. 3. Provide rescue equipment and training. 4. Make sure the fall clearance is sufficient to avoid both swing hazards and the ground or nearest obstruction below. 5. Select PPE that includes trauma straps or loops or a personal rope ladder to avoid suspension trauma. 6. Provide hard helmets with chinstraps. 7. Have a trained first aid/or on site when possible. | |

Work Safely with Silica

A ONE-STOP SOURCE OF INFORMATION ON HOW TO PREVENT A SILICA HAZARD AND PROTECT WORKERS

About • Know the Hazard • Regulations & Requirements

Know the Hazard

Workers may be exposed to dangerous levels of silica dust when cutting, drilling, grinding, or otherwise disturbing materials that contain silica. These materials and tasks are common on construction and oil and gas jobs. Breathing that dust can lead to serious, often fatal illnesses. This section contains information that workers – and contractors – need to know to recognize the hazard, understand the risk factors, and work safely with silica.

Training & Other Resources

Find silica-related handouts, fact sheets, videos, toolbox talks and other resources for workers and contractors.

Discussion

1. What feedback do researchers have based on their experience working with the r2p program?
2. What components of the r2p program (e.g., specific partnerships, resources, priorities) have outlived their usefulness, if any?
3. What are the key components that should be part of the CPWR r2p program regardless of future funding?
4. Are there any components that should be revisited or brought up-to-date in some way?
5. What's missing from the program?
