Hearing Impairment among Older Construction Workers

**Hearing impairment and tinnitus among older construction workers employed at DOE facilities**

**Key Findings**

- More than half of the study cohort suffered from hearing impairment, including 57.7% of men and 26.8% of women.
- Prevalence of hearing impairment, and of tinnitus, increases considerably with age, with nearly 95% of construction workers older than 85 having a hearing impairment. Within the age category when many workers retire (56–65), 56.34% had hearing impairment.
- Workers in the construction trades were significantly more likely to have a hearing impairment than those who work in an administrative, security, or scientific capacity, 56.73% compared to 41.18%.
- Among the trades with 100 or more participants, boilermakers and carpenters are the most likely to suffer from hearing impairment (65.79% and 65.28%, respectively), and boilermakers experience the highest tinnitus prevalence (64.25%).
- Asbestos workers experienced the lowest prevalence of hearing impairment (46.52%), while electricians experience the lowest prevalence of tinnitus (46.81%).
- To draw conclusions about the risk for work-related chronic diseases and disorders, it is important to monitor workers through their lifetimes. The current research reinforces the need to promote noise reductions and hearing conservation in construction.

**Overview**

Occupational hearing loss is the most common work-related illness in the U.S. and can lead to anxiety and an overall loss in quality of life. Workers in the construction industry frequently experience excessive noise on the job and are among the workers most likely to suffer noise-induced hearing loss, as well as tinnitus. However, few studies have looked at the risk of hearing loss after retirement for construction workers. This research measured hearing impairment and tinnitus prevalence among older construction workers, including retirees, by examining data from more than 21,000 participants in the Building Trades National Medical Screening Program (BTMed). BTMed provides medical screening exams to construction workers formerly employed at Department of Energy nuclear weapons sites, who may be at increased risk for occupational illnesses. The researchers gathered audiometric data from BTMed participants, as well as self-reports of tinnitus, and analyzed the prevalence of hearing impairments by job category, sex, and age.
